My idea was to have groups or sets of frequencies that you pre-define. For example, 2m repeaters for a city in one set. Frequencies for working a particular satellite in another. These groups and individual frequencies can then be added to any number radio configurations in any combination. I hope that I'm explaining this clearly enough.

The software will not be free. I thought that it would be better to say so up front. But since it's a budget radio, it will be priced fairly. I'd like your feedback on the price as well. The tools that I use mean that there will be a native macintosh, windows, and linux version. One license will let you run all three versions. And I'd like to add support for

other wouxun radios as they're released.

Let me know what you think.
Simon

Tried the Wouxon on the air bands yes the frequency will go that low - no it will not receive it.

For my full report on the how and whys of it it all it on the the AURFSCAN web site .

So no need to reproduce it all here

Aircraft use AM - so the Wouxon is probably not much use for this.

This is a great idea i especially like the idea of the predefined sets as i use my radio for satellite work and also have my v/uhf repeaters programmed into it plus a couple of non amateur frequencies that i listen to. I for one would'nt mind paying for the improved program.

Subject: [Wouxun_KG-UVD1] Suggestions for new KG-UVD1/KG-UVD1P Programming Software

Hi Everyone,

I'm in the process of writing an application to program up the Wouxun KG-UVD1P radios. I can read and write to the radio already, and have written most of the code for how I think that it should work. But since we all use our radios a little differently, I though that it would be better if I asked for your feedback and suggestions before going any further.

One approach is to simply mirror what the current software does, but just fix the areas where it's deficient. This would be quite easy, but since I'm starting from scratch, why not improve on it. Hopefully wouxun will keep improving their own software.

My idea was to have groups or sets of frequencies that you pre-define. For example, 2m repeaters for a city in one set. Frequencies for working a particular satellite in another. These groups and individual frequencies can then be added to any number radio configurations in any combination. I hope that I'm explaining this clearly enough.

The software will not be free. I thought that it would be better to say so up front. But since it's a budget radio, it will be priced fairly. I'd like your feedback on the price as well. The tools that I use mean that there will be a native macintosh, windows, and linux version. One license will let you run all three versions. And I'd like to add support for other wouxun radios as they're released.

Let me know what you think.

Custom programming software for the Wouxun? Nice. I would like to be
able to cut/copy/paste more than just one field at a time. Being able to
copy/paste from an Excel Spreadsheet would be very handy.

Be certain your anti-virus is running. The factory software is loaded with malware. I've become infected with both the Downloads or Disc.

As far as I'm concerned if the factory software would just let you sort
entries by any of the columns it would be great.

Hi Simon,

I expect that there are some functions which are specified in the ".tw" file which are not modifiable in the Wouxun software. For example, I believe that the last channel selected is in the ".tw" file, but can't be explicitly set from the Wouxun programming software.

Do you have a list of all functions which can be set from the ".tw" file? For example, can the ".tw" file specify that the radio should start up with dual-radio mode not selected? Do you have a file layout of the ".tw" file, showing every possible parameter that can at least potentially be programmed?

It's nice that you are working on something that is more "humane" then the factory software for the radio newbie's.
If you dealt with the batwing and others, this factory software is not that bad in comparison.
The main problem that I can see is that the CH programmers are using CH language based software tools and when the conversion is made to "westernize" it some of the nuances do not follow (Cut and Paste being one.
Knowing that the KG-UVD1P functions in the "codeplug" arena which will not play well in a on the fly type of programming, and the radios bells and whistles are limited in comparison to the "fancy" K,Y,I radios it may be a bit harder to produce second source software that would be cost effective . I second the call for a way to easily do a cut and paste from an outside source and to import and export from a spreadsheet.

For ideas and inspiration, it is worth a look at Jim Mitchell's freeware: http://www.kc8unj.com (He does programming s/w is for Yaesu, Vertex & Icom handhelds).

Simon, perhaps you could collaborate with him; using your Wouxun communication code with his spreadsheet-style user interface. (It already has robust import/export, copy/paste, row manipulation, etc).

At any rate, credit for getting the ball rolling Simon, and we are looking forward to seeing your early offerings.

Malwarebytes has given me a trogen message and stopped the program and AVG keeps poping up unidentified virus activity to internet every time I run the program and lock the internet. I currently use the program only on an old laptop computer that is not connected to the net or my network. I use this computer only for programing of old radioes with doss software so I am running it under windows 98 se at present. I would be willing to run it on my regular shack computer with windows XP if I could trust the program.

I don't know KC8UNJ but I use his FT-60 Commander program. It is a great example of a good quality program. Not many frills but does everything you need it to and at least in my experience it always works. I'd love to see him produce a KG-UVD1 program or collaborate on one.

Mc Afee indicates no problems at all. The download scanned clean, and the
install and operation indicated no problems. Try downloading the file HERE, I
uploaded it, and it is definitely clean :)

An option to program some memories with squelch open for sat work whilst squelch closed on the repeater memories would be good.

I run Norton 360 4.0 and every time I've downloaded the programming software it lets me know that this is a dangerous site or blocks it. One time it stopped the download and told me it must restart my computer to remove infection. So there can be a problem with some of the Wouxun software.

Agreed, and Mcafee isn't much better. Evil nasty stuff, I tell you. Here's the one I use, and they're fantastic. 30-day trial, and you can get a 10% off coupon. Or at least, I did, suspect you still can:
http://www.sunbeltsoftware.com

Good stuff, reasonably priced, screen reader friendly.

Try AVAST

It is free for non commercial and works better than Norton or McAfee

Google AVAST and select free home edition

Enjoy

I saw some message from other place about the Nagoya antenna on Wouxun radio and forwarded it here as below:

Yes the antenna connector is a female SMA. There are a good number of
after-market antennas using this connector, Nagoya being one that comes to mind. From my testing, and the discussions found on forums, the stock
antenna performs quite well. Most people can tell little, or no difference between the stock antenna and one of the longer after-market antennas.

Regards,

I have found this longer antenna I got at Hamvention (probably a homebrew job) far outperforms the stock antenna on 2m. On UHF the stock antenna is a winner. THe stock antenna IS effective on 2m; so a lot of the time I still prefer it.

honestly i have to say i am more than impressed with this little radio. i had already downloaded and setup the software so when it arrived i had it programmed and setup in less than 5 min.

my first impression was the tx/rx is better than my vx-7 with a diamond srh320a antenna. i was able to key a repeater 22 miles away inside my house. my vx-7 has never hit it from here. not enough to actually talk on the rpeater but it did key it which surprised me.

it's definantly not as robust as the vx7 but for the money this is an excellent rig if it holds up well.

i am VERRRRRRY happy with this purchase.

after playing with the factory software i have identified one thing it REALLLLLLLLLLY needs.

the ability to insert blank channels between already programmed rows.

i had mine setup and realised i had forgotten a channel and had to redo a long list to put it where i wanted it. it was a PIA.

1589. Re: Suggestions for new KG-UVD1/KG-UVD1P Programming Software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-11 14:49:04 UTC
From: steve_ve6vs
Topic: 1536 Message: 1589

I assume you mean having an empty channel slot unassigned for future use. If you are using the external programming cord and software it is no problem. There are a number of examples of this on the files page. Now if you mean you want to insert a channel inside an already complete block, the only way is to manually reprogram. Personally since I have a number of channel numbers committed to memory this would not be a feature for me since it would shift already assigned numbers.

1590. VIRUS ALERT in v1.15 file

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-11 17:22:24 UTC
From: steve_ve6vs
Topic: 1590 Message: 1590

My computer anti-virus decided to pull the v1.15 programming file it says it has a

IM.worm.win32.licat.dy

This file has been working fine but to be safe I'm reverting to 1.13
I downloaded the file from both the files section and the manufacturer site.

I use Radialpoint SafeCare Inc anti-virus which is supplied by my IP Telus Canada

1591. woxun and cw

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-11 18:34:28 UTC
From: dan.wb5do
Topic: 1591 Message: 1591

Some people have been hearing cw when they turn there rigs on. This is the rest of the story. When you turn the rig on with voice on it goes "beep beep beep beep" or M M in cw. When you turn the voice off it does another thing when you turn it on. It goes "beep beep bep bep beep bep" or M F in cw if the rig is in a channel mode. If it is in the frequency mode it only goes "beep beep bep bep beep" M U.

Now we know the rest of the story.

1599. New Wouxun Eyes-free Document: Correction

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-12 01:42:34 UTC
From: Buddy Brannan
Topic: 1599 Message: 1599

Hi,

How did I miss this?

The options for frequency step were wrong (and one off), now should be correct. I forgot about the 6.25 KHz frequency step. So, everything was one number off, and if you used anything but a 5 KHz step size, no doubt you were wondering what the problem was.

For those copied on this that are not on the Wouxun Yahoogroup, get the file here:
http://dl.dropbox.com/u/1053407/kg-uvd1p-eyes-free.rtf

If anyone notices anything else I managed to screw up, please don't hesitate to set me straight :)

The radio has to switch between the two frequencies on the display and also goes in to a power saving mode. This meens there can be a delay while the receiver wakes from power saving and opens the squelch. I assume this only happens after the receiver has been idle for some time.
That's my guess!

From: fogger1969
Topic: 1536 Message: 1606

Hi everyone.
Thanks for all the constructive feedback. A lot of what's been suggested I've heard mentioned before, but there are a few new ones as well.
- Copy and paste from a spreadsheet is the one feature mentioned the most often. It will definitely have the ability for this, but I need to get the basics going first. - Printing should be able to support any paper size. - Sorting of columns is already there. As is dragging & dropping frequencies to re-order them. - Proper english terminology.- Accessibility - Keyboard navigation using tab, shift tab, and arrows. Already done. But will need refinement.- Support tw file - Should be easy enough because it sort of mirrors what's going on inside the radio.- Non-AlphaNumeric Characters - I haven't tested to see what characters are supported, but the radio doesn't use the standard ascii character set. Whatever the radio can handle will be supported.- Unlock - I'm wary of adding unlocking of the radios. It's easy to do, but I'm worried about the chance that doing so could damage the radio.
- Price - No more than £10/US$15.
I'm using Real Studio <http://affiliate.realsoftware.com/TsWmjLUQ> to write the app, so it will have the native look and feel on each platform. With so many people buying macs these days, and linux being more popular than ever, I don't understand why anybody would write a windows only application when it's so easy to target all three.
It sounds as though there's enough interest, so I'll keep going with the app. Keep the suggestions coming.
Simon

Since you claim its not a false positive, you have found the program reading the registry and attempting to over write Messenger?

Thanks,

Michael H. Cox

Topic: 1590 Message: 1614

I ran the v1.15 file using SysInternals Process Monitor and examined all file and registry accesses while programming my KG-UVD1. No unusual activity at all. I have a log of all file and registry accesses if anyone wants to see it. Also, Trend Micro and Microsoft Security Essentials detected nothing. I think any virus indications are false positives.

Heino R. Pull KD0LKI

1615. Can you really open the 220 to do 440 or make the 440 version do 220?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-12 17:54:22 UTC
From: w4wsm
Topic: 1615 Message: 1615

There are very few comments about opening up the 220 band on a 440 radio or the other way around. I've looked at the unlock software but has anyone actually taken a radio and had usable results with it?
If you have please reply and let us know which band yours started out as.

Can't decide yet which version to get but if I can change it later that would be great!

Thanks!
Ben

well i thought that i might turn off power saver and run it on single band and i think it still does that misses a few seconds of the start of transmission..any ideas thanks

I just tested mine with a second HT and found no significant delay. There is a slight (maybe <100msec) squelch open delay which I think is normal.

The radio is FM, and "air band" uses AM, so you are not going to be able to pick up aircraft.

Where did you see 455.65MHz? The UHF band is normally used by most of us to cover the 70 cms UHF band (432MHz) but I know it works just fine on 446MHz and the specs say that it covers 400-480MHz, so should be no problem if you want frequencies in the 455 MHz range (who are they allocated to??!!??)

I comcur. What unlock software can do and what the radio can do are different issues!

NONE of these radios either the 440 or 220 version (2 m included) will work outside of their design limits.

Tried myself... no go.

What a frequency display shows you is totally different from what a radio can do!

The unlock software was written for both models, so, naturally, it has a variety of frequency coverage.

I have heard, maybe here, that pushing a radio over its limits will lock the pll and make your radio useless !!

Think about it this way... If the software could open it up to do all of it, why wouldn't Wouxun sell it as a triband radio?

Thanks,

What a frequency display shows you is totally different from what a radio can do!

The unlock software was written for both models, so, naturally, it has a variety of frequency coverage.

I have heard, maybe here, that pushing a radio over its limits will lock the pll and make your radio useless !!

Dave,
I Concur.
I have MIA and FTLD in approach and Tower in my radio and it works well if not better then my old TH-77.

And for the newbies.
When you enter the RX just do not enter the TX and you will be safe....
Regards.

I am a little surprised even though their upper limit is 280 and I should have worded my comment differently. I didn't mean the expansion wouldn't work at all, just not as high as 440. Maybe I'll check one out with a meter someday and see what the extreme limits are.

From: Jim
Topic: 1640 Message: 1640

Hi everyone,

I'm trying to input my local repeaters. Most use a pl tone of 100 in this part of lower michigan. How do I program the radio? I have the software and just don't see it. Maybe I'm overlooking something here or maybe different terminology is used in the software and manual.

Thanks 73

Jim K8ELR

Put the repeater tone in the Encode CTC column in the software. THis will put the tone on your transmitter to the repeater and open the repeater. Normally, don't use Receive tone because the repeater may not transmit a tone.

It seems that the software is not the problem, and its down to the AV supplier to deal with it. This is the usual practice - and false positives aren't that uncommon.

However, the provider of the AV application needs to be made aware of the problem - it won't change unless one of their employees buys a Wouxon ;)

Thanks for the feedback - I have never seen this crackling / pop from an HT in FM radio mode before Wouxun. Interesting part is it will not do it on some FM stations and on Some if you hold the radio with one hand & grasp the stock antenna it will stop & not crackle/pop,& you can place radio on table No popping.... But if you scan or the radio shift over to monitor 2m/or 220, go back to radio mode it will crackel/pop - on some hold radio grasp antenna will go away agian. Strange & far from correct. 73 K1WJ David

I think the FM broadcast receive is hosed.
Seems to have a problem with wide deviation signals.

I have noticed it more on weak signal's, but is fairly rare now that I use a higher gain dual band antenna on the unit.

I also have a Puxing 888 UHF which has FM receive as well & it does not get the same crackle.

It appears many KG-UVD1P's have this problem - I'm talking to one of the US distributors & they are going to contact Wouxun Inc. in China about this issue. In the mean time I'm trying to get the smaF-bncF adaptor so I can try some different antenna's to make this FM radio speaker pops minimized. I mean on some of the stations the speaker will pop/crackle to the beat of the base drum in a song - this is basically a joke -I just got involved with Wouxun HT's last week & cant see why this was not resolved by Wouxun a long time ago, it took me about 3 minutes after turning on this HT to hear that something was far fronm correct. - If this is where China HT's are at - it will be the last one I purchase -but hoping to resolve. If other antenna's make this go away as some have stated, I will post. 73 K1WJ David

Don't dog the whole radio because of this one feature most HT's don't even have this feature..... Hooking up a quality antenna will help the issue! Love this radio

Hay stu i'm a little like you i got mine truned off i got mine to be a dual bander and so far it has done a good job doing that

but if they put the button on the box i think it should work

would i buy another yes yes yes but not to listen to fm on

Not being a Windows 7 guy, I'm at a loss when a customer or potential customer ask me a question about Windows 7.

Would it be possible for one of you guys with Windows 7, that has successfully installed the driver and have the programming software working, to post a step-by-step on the process?

Write it as though it were for someone like me who's never used Win 7. Writing this how-to and placing it in the Files section would be good.

I had this issue as well Ed ..
I installed OTHER Pl-2303 drivers.
In my case it was the ones that came with
my trendnet usb 2 serial cables ..
Perhaps the drivers are available on their website.
If not, let me know I will send you a CD .
I told the 409shop about the issue had the fix
I had implemented in case anyone else queried them.
They didnt seem interested. OR their english is
really that bad ..

I had this issue as well Ed ..

I installed OTHER Pl-2303 drivers.

In my case it was the ones that came with

my trendnet usb 2 serial cables ..

Perhaps the drivers are available on their website.

If not, let me know I will send you a CD .

I told the 409shop about the issue had the fix

I had implemented in case anyone else queried them.

They didnt seem interested. OR their english is

really that bad ..

Subject: [Wouxun_KG-UVD1] Re: FM Radio makes speaker crackle.....

It appears many KG-UVD1P's have this problem - I'm talking to one of the US distributors & they are going to contact Wouxun Inc. in China about this issue. In the mean time I'm trying to get the smaF-bncF adaptor so I can try some different antenna's to make this FM radio speaker pops minimized. I mean on some of the stations the speaker will pop/crackle to the beat of the base drum in a song - this is basically a joke -I just got involved with Wouxun HT's last week & cant see why this was not resolved by Wouxun a long time ago, it took me about 3 minutes after turning on this HT to hear that something was far fronm correct. - If this is where China HT's are at - it will be the last one I purchase -but hoping to resolve. If other antenna's make this go away as some have stated, I will post. 73 K1WJ David

I just got mine on saturday from wouxun.us.
It has something to do with the stock antenna i think the connection is a little loose i have to tighten it to stop the noise the connection after tightening it is still wobbly hopefully changing the antenna will fix it.

Brian,

Your antenna should not be loose. I've never seen one with a wobbly antenna, so if that's the case with yours, we should swap it out for a new one. Wouxun did a good job of providing a large base on their antenna to give it good support. It should only take slight finger pressure to seat it firmly. Let's change yours out if it's defective.

Date: 2010-07-19 13:53:45 UTC
From: Sailor
Topic: 1674 Message: 1674

I have one repeater in my area that I have to set the squelch on like 8 to keep the noise from coming through. Can I assign a squelch to this freq only, leaving the others back on 5?

Using the programming software you can set different squelch levels for Band A and Band B, but not for individual channels.

Some comments on the crackle. Remember the receive bandpass for this radio is designed around typical two-way bandwidths. Broadcast FM is substantially wider and getting a demodulator circuit to handle both is a challenge. Remember also that a typical FM station transmits a main signal of L+R, a sub-carrier of L-R, and maybe another sub-carrier with commercial background music. Then add to this the fact that the music is often conditioned. I worked on one modulation monitor for CHUM-FM where the average meter read 30% and the peak light was on almost solid. Those were head-banger days but broadcasters do their best to make the signal sound impressive. With marginal signal the Wouxun will not fully capture the signal and one result is the snapping sound usually in time to the program.

I didn't get it for the FM radio, its a nice add-on but I live with a lot of the minor issues with this price range radio.

What i was saying is that it is on fine but to remove the crackling i have to tighten the antenna really hard and if i just tap on the antenna a little the crackling comes back it is fine because like others have said i am getting another longer antenna

I want to use the KG-UVD1 as an APRS transmitter and need to confirm the pin-outs on the MIC (3.5 mm) and SPKR (2.5 mm) ports. Both these ports are stereo.

Has anyone used these ports for data communications like APRS and packet? Can these ports be used directly or is an interface needed?

Thanks to Buddy Brennan for the operating manual for blind ops in the "files section" - I browsed it and found that it had quite a lot of useful information that is incomprehensible in the maker's manual - for us sighted hams as well!

(For example, I didn't know that you could rotate the cover for the speaker/mike connection out of te way, so that it's much easier to get the programming cable FULLY home!)

It's worth reading and/or printing.

I want to use the KG-UVD1 as an APRS transmitter and need to confirm the pin-outs on the MIC (3.5 mm) and SPKR (2.5 mm) ports. Both these ports are stereo.

Has anyone used these ports for data communications like APRS and packet? Can these ports be used directly or is an interface needed?

I bought a nice cable to use to interface the KG-UVD1 from Argent Data Systems, Santa Monica, CA 800-274-4076. Part Number 000070 Speaker Mic Cable- Kenwood type, $6.00. It has a molded connector on the radio end and tinned conductors on the other end.

I think that the later model (the "P") is the only one where you can push the search button while transmitting to give a 1750 Hz repeater access tone.

Believe UVD(1) may not have had DTMF. There was then an interim model between that and current "d1p" that had DTMF but the duration of the tones was so brief that many had problems with repeater dialing or echolink. Current model activates DTMF tones as long as key is depressed. Just a thought.

I have been using my radio for packet and APRS for a couple of months and it works great. I got a pigtail already color coded for kenwood style radios from argentdata.com and it was only $6.

Well glad to hear changing your antenna fixed most of your speaker crackling in FM radio mode - but for my HT it made no difference crackling still there. Ed at wouxun.us is going to send me another 2m/220 version & take back the crackling one I have. Hope it is just my radio - I must say that Ed at sales@... is the best place to buy these HT's - he has been outstanding through the sale & dealing with this speaker crackling issue. Ed rates 10 out of 10, do not bother buying wouxun's from anywhere else - Ed is the best. K1WJ Dave

1701. problems changing settings in optional function in software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-22 17:52:11 UTC
From: holmebrian
Topic: 1701 Message: 1701

I am having a problem with optional function tab in the programming software.
When i change the channel display way and send to the radio it resets everything back to default and changes the voice to Chinese and anything set in the optional function does not get set.
I have tried it with both the v1.13 and v1.15
Both do the same thing if i set it to something other than VFO.
The memory transfers fine only the settings are not set.

Any help on this or is it something that is known and just cannot be set?

I have experienced this a couple of times. What seemed to fix it was to Read the Radio, Change the settings, Write the radio. I have not figured out what is happening and it does not always exhibit the problem.

I am using a saved file that i originally took from the radio. So you are saying i have to make a new file every time i want to change settings in there?
I should be able to read from the radio once save the file change the settings and then load it later after changing settings in the file.

I repeat- When I had the problem of the Optional Functions not loading to the radio properly, I found that Reading the radio, Changing the settings, and Writing the radio seemed to resolve the Optional Function problem. I normally simply save a file of the desired radio configuration, however a few times I have had the problem of the Optional stuff not loading correctly from the saved file.

Hi guys,

I'm wondering why when I try to go directly to a specific channel # between 01 and 19, I cannot simply enter the channel by entering it on the keypad. It works on channels 20-128 but the lower 19 do not.

I've tried entering 0-1, 1, 001, etc. with no luck to get to channel 1.

Ed

001 through 019 should work. They do here. But you definitely need to enter three digits.

Thanks Buddy.

Duh, now it works fine. All this time I couldn't get it to work.

The answer is definately to enter 3 digits.

Ed

1711. Tiger Tails and the UVD1-P

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-24 18:36:47 UTC
From: ke5ofo
Topic: 1711 Message: 1711

Hello,

I just got my UVD1-P this week and so far really like this little raido. I bought it to replace my old FT-470 that I carried around at work. One of the first things I did was to put on my Diamond RH77CA witch has a nice 19" counter poise attatched via a hose clamp. I have found that this antenna which I have used on multiple radios is one of the best setups for an HT. The only issue that I seem to find with this on the Wouxun is that my counterpoise wire makes this thing a bit hard to set up on my desk. After doing some research I am thinking about trying the Nagoya NA771 with a thinner counterpoise wire and was wondering if anyone else here was running a setup like that and how well it works.

Thanks
Kerry

Lee, you use the N771 with which radio?

I also own a KG-UVD1p....n was thinking of a better antenna.

E.ham reviews for the N771 are great though....

well i originally bought the antenas for other radios but they packed up , i then bought the KG_UVD1P and i put the nagoya 771 on to help with the crackling on the radio stations , which has cleared it up, i dont know about how well it comunicates with the arial on, i only use the radio to speak to another radio while we are flying, the repeaters and other things you can do with the radios is well above me

I bought an Nagoya NA771 for mine, after using a Diamond RH77CA with a bnc adapter, actually, I honestly believe nagoya makes diamonds antennas, they are way too close physically. I'm seeing (hard to honestly tell) that the nagoya is AS GOOD if not slightly better than the diamond. As to a counterpoise, I've never tried it, a new project to try now :)

Follow up: RH77CA vs NA771.....(had to stop and try this), one on each of my FT470s, the nagoya wins by about an s unit...and soooo much cheaper....

The Nagoya 771 is over twice as long as the one that comes with the HT. Nearly
a full 2m 1/4wavelengh in size.

The Nagoya 775 is built up a bit better at the base. I've had two 771's Female
SMA antennas break on me.

I figured this is secret enough I could get cash, but no offers!
Dealer Mode
Press 8 and then Power On
Password 268160
I don't see any real use however. If I turn off Menu with the software, this doesn't enable Menu, so I really don't see the value yet.

The Nagoya is about 15.5 inches from stem to stearn, much longer and much better built than the OEM

> > > >
> > > > I just got my UVD1-P this week and so far really like this little raido. I bought it to replace my old FT-470 that I carried around at work. One of the first things I did was to put on my Diamond RH77CA witch has a nice 19" counter poise attatched via a hose clamp. I have found that this antenna which I have used on multiple radios is one of the best setups for an HT. The only issue that I seem to find with this on the Wouxun is that my counterpoise wire makes this thing a bit hard to set up on my desk. After doing some research I am thinking about trying the Nagoya NA771 with a thinner counterpoise wire and was wondering if anyone else here was running a setup like that and how well it works.

" how do you get out of it?
Looks like when you power cycle the radio, it cancels the dealer mode so if changed a power setting in dealer mode, you have to re-enter the dealer mode to change it back...

This is how the radio should be running regularly not being able to change settings on saved frequencies sucks. At least with this you have a way to do it without using a computer.

Interesting - on eBay UK there's just one supplier advertising, and the price has gone way up - Including delivery it's only about ?15 (US$20) cheaper than buying from the new UK Official Distributor (who charges $150)

Guess they decided that it was such a bargain originally that they could put the Hong Kong price up, instead of giving the distributors a good dealer discount!!

Well i guess it is time for some competition in the UK TYT makes a very good Dual Band HT it is the TH-UVF1 CE FCC Approved I think the Radio programs with keypad and software with less headache than the Wouxun too.

They Have them at 409shop.com or send Sam an email at the factory and tell him you want to buy a sample. It should run you around $120.00 us UPS express shipping include.

Tell Him Dan Sent you

Actually Buddy, I only have a few of the 2m/220 versions of the KG-UVD1P left. All my new radios that are coming in are the new KG-UV2D model. Still the same competitive price as before. Although it's the same radio inside, I have had the factory make a software mod just for me. Now when you switch between Frequency Mode and Channel Mode, the default display for Channel Mode is NAME. This seemed to be the most popular default and for those that wish to see the frequency, they can use those numbers as the name. Should cut down on the wear and tear of menu 21. Buddy some day I will get an eyes free web site posted.

73
Ed
Wouxun.US

ps. Your Eyes Free manual is prominent on my web site and will be mentioned in the upcoming QST review of the KG-UVD1P and KG-UV2D.

Hi Ed,

Thanks much, and great news on the mods and the eye-sfree doc. Now, all I need is to get the menu section filled in more completely.

So the KG-UVD2P is basically the same? Is the keypad layout the same as well, and how much will the doc need to be adjusted to account for it?

Ooh! Do I detect regional dialect differences a-brewin? Here's something I found on this about a month ago, by some unknown bulletin board posting person:

Hi All,

I note that on one of the chinese import yahoo groups there was a ...feisty....exchange on how you pronounce
WOUXUN.

some said , "WOW_SUN" , others WASHING, others "WOO-SOON" and more besides .

so I asked a native chinese speaking friend from Singapore for a definitive answer.

He replied :

Quote:
From the Chinese characters: "欧讯" should be pronounced as "O" (as O in Oval) and "shin" (the lower part of your leg)
The correct Chinese spelling should be "OuXun".

“WouXun” I believe is a mis-spell... oops!

If you pronounce it as Chinese.. it should be "O-shin".

If you pronounce "WouXun" in Chinese it should be "Wo" (as in woah! woah! hold your horses!) and Shin

If you talk to a Chinese person.. saying O-shin will impress him.
If you talk to a non-Chinese person .. Wo-shin sounds better.

I asked also if "OuXun" translated or whether it was just a brand name ?

apparently its "Europe (or european) Communications"

SO...there you have it! At least now if someone asks you what radio you're running (assuming its a [w]ouXun) you can tell them.

regards

BB

Mine is only a little discharged (I'm recharging it now and will report back) and it's 8.2v. I think it goes to 8.4 on full charge.

It doesn't seem to take too long to charge up from nothing, but I only ran it right down once and didn't notice exactly how long it too. But it DOES take longer if the radio is switched on!

Hi Ed,

I'm in UK and wondering whether it's better to wait for the new KG-UV2D before buying a second rig (for the XYL); I currently have the UVD1 and I can't see any striking differences in spec to the new one (from your web site). Are the two rigs compatible regarding the programming software and/or the frequency files (It would be nice to run the same software, or at least to be able to use the memory files for each job they have to do and to load both radios)

On the other hand, if the new radio has important new features . . . . . .

Actually Buddy, I only have a few of the 2m/220 versions of the KG-UVD1P left. All my new radios that are coming in are the new KG-UV2D model. Still the same competitive price as before. Although it's the same radio inside, I have had the factory make a software mod just for me. Now when you switch between Frequency Mode and Channel Mode, the default display for Channel Mode is NAME. This seemed to be the most popular default and for those that wish to see the frequency, they can use those numbers as the name. Should cut down on the wear and tear of menu 21. Buddy some day I will get an eyes free web site posted.

73
Ed
Wouxun.US

ps. Your Eyes Free manual is prominent on my web site and will be mentioned in the upcoming QST review of the KG-UVD1P and KG-UV2D.

Stu,

I am told the insides are the same, just a different case. Nothing has been said about any programming differences. The ones shipped to me are supposed to me modified as mentioned below. I won't know if this has happened until they arrive this coming week.

I have noticed on mine if any of the contact on the battery or the charger are dirty that it will not show when charge is complete! Does not take much on them for this to happen so I wipe them off with a dry eye glass cloth every time I put in charger.

8.4V is what I see my radio at when I take it off the charger. Let it go...
just feel it to make sure it doesn't overheat, although the charger and battery
have a temp sensor. A newer battery may
take less time to charge, because it hasn't been "exercised" enough to bring it
to full capacity.

1753. Re: Dealer Mode- What is it for?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-07-30 20:07:00 UTC
From: jwheatleyus
Topic: 1721 Message: 1753

Here is little more info regarding Dealer Mode that I found---

When you have a channel programmed, the radio will not let you change power, tone, busy lock, wide/narrow etc from the keypad. Dealer mode allows such changes.

Dealer mode Does Not allow changes when the software has programmed Menu OFF.

When you are in the open or computer and programming cable are not at hand, you can change the high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth and parameter on every channel through the dealer operation mode.
Operation Method:
Holding on [8] key and powering on the transceiver at the same time, then inputting password "268160", the transceiver enters dealer operation mode.
When you are changing the above parameters on channels, please firstly call out the channel that will be changed, and set it as the master frequency through [A/B]. Then you can change the parameters of high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth .
SAVE & EXIT: Press [MENU]+ [A/B]. This permanently stores the change(s).

Okay - It has stabilised at 8.4v, and the charger is showing Green. But remember:

1) The charger will always show red if the radio is switched on - even fully charged.

2) 0.2 volts is only just over 2% of terminal voltage. Think "tolerances". The radio should receive easily for a day or more on a charge, and not much less with occasional QSOs throughout the day. That's pretty good battery life as, even if you are using it truly "hand-held", you can usually charge it every night.

Ooh! Do I detect regional dialect differences a-brewin? Here's something I found on this about a month ago, by some unknown bulletin board posting person:

Hi All,

I note that on one of the chinese import yahoo groups there was a ...feisty....exchange on how you pronounce

WOUXUN.

some said , "WOW_SUN" , others WASHING, others "WOO-SOON" and more besides .

so I asked a native chinese speaking friend from Singapore for a definitive answer.

He replied :

Quote:

From the Chinese characters: "欧讯" should be pronounced as "O" (as O in Oval) and "shin" (the lower part of your leg)

The correct Chinese spelling should be "OuXun".

“WouXun” I believe is a mis-spell... oops!

If you pronounce it as Chinese.. it should be "O-shin".

If you pronounce "WouXun" in Chinese it should be "Wo" (as in woah! woah! hold your horses!) and Shin

If you talk to a Chinese person.. saying O-shin will impress him.

If you talk to a non-Chinese person .. Wo-shin sounds better.

I asked also if "OuXun" translated or whether it was just a brand name ?

apparently its "Europe (or european) Communications"

SO...there you have it! At least now if someone asks you what radio you're running (assuming its a [w]ouXun) you can tell them.

regards

BB

Makes sense... The charger sees this current draw and tries to compensate.

ROFLMAO no not a stun gun, but a stun function to temporary disable the radio remotely with a dtmf code, my Puxing has it, but I have never used it.

LOL what a strange thing to call it, though. I think a stun gun would be much more interesting.

I just picked up a pigtail from argentdata.com. I'm a little confused because the breakout is only four conductors, with no common ground. Is there a pinout reference somewhere? How do you have yours tied into your APRS TNC?

Thanks & 73,

I used the following Argent colors for hooking up my BlueTooth adapter:

White- Mic
Black- PTT
Red- Spkr
Blue- Gnd

John,

I'm wondering if we have the same cable. The pinout for mine is:

WHITE ---> ring of MIC plug (TRS, large)
BLACK ---> sleeve of MIC plug (TRS, large)
RED ---> tip of SPKR plug (TS, small)
BLUE ---> sleeve of SPKR plug (TS, small)

I tired the configuration you provided. RX from the speaker output works fine, but the mic/PTT seems off (PTT permanently ON.)

Swapping the white & black wires, now PTT works properly, but instead of the external signal being fed into the MIC input, the mic on the radio itself is what ends up on the air.

Note that the tip of the large TRS (mic) connector is not in the pigtail's breakout...

So I guess I'll have to source a pigtail with all 5 connectors?

Thanks for your help,

73,

- Charlie, KI6RRX / NNN0PHC

I think we have the same cable. My pinout is same as yours.
To use it,
Mic is White to Blue
Speaker is Red to Blue
PTT is Black to Blue

Tip of large pin is not used, so no wire connected.
This pigtail should work for you.

I ordered my cable today... I can wire it into my Rigblaster and go to town.... Naturally, the speaker output would go into a separate cable to the soundcard of my computer.

I may even see if the radio's built in VOX function would work,, then no keying circuit is needed... I can cobble something to go direct to and from the soundcard directly.

I have owned my Wouxun KG-UVD1P since February. I bought it at the Dalton, GA Hamfest. My father was so impressed that he bought his about 5 minutes after inspecting mine!

I am purchasing the accessories as I can, and am currently looking at external speaker mics. Are there any recommendations? Any that I should steer clear of?

Any help would be greatly appreciated.

Thanks for a great yahoo group!

The Kenwood SMC-34 speaker is not very good- really tinney (sp?). Kawa on eBay has Kenwood compatible units for about $10 and they are OK. I have really bad hearing so I just ordered a good quality Heavy Duty unit from Henry Radio ($50). Hopefully it will be worth the $.

We could always find an Echolink conference server to host such a net, or an informal schedule to link all nodes/users together... That way.. those without HF can get on the net.. and actually user their Wouxuns :)

I use a Mic from Kawa on ebay. It cost $19.99, & $1.99 S/H. And I get audio reports that I sound just as good as a Base staion. It's listed as a BRAND NEW EXCELLENT QUALITY HEAVY DUTY aftermarket Remote Speaker Mic with PTT button that works flawlessly with kenwood. You will love this with your Wouxun.

1780. Battery life problem

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-01 20:06:31 UTC
From: ffdjeff
Topic: 1780 Message: 1780

I am having a problem with the batteries on my KG-UVD1. After installing a battery it only last a couple of hours...even if the radio is off. I have two batteries and they both act the same way. Could be a battery problem but I don't think so.

From: pache11@aol.com
Topic: 1780 Message: 1781

If you have the battery eliminator you could check amp draw when volume/power-switch is turned off with an ammeter or power supply with built in ammeter. I use a set of aligator clips with my power supply to check current draw as my supply has a built in ammeter.

Just want to thank those that responded to my charger question. I let it run down a bit and stuck it back in the charger and just left it. The light did eventually turn from red to green and it was at 8.2V at that point.

That's what you need, essentially an SMA barrel connector. I got mine at Radio Shaft, which means I probably spent too much.

I have to ask why you want SMA M to F? That combination isn't normally needed. The KG-UVD1P is SMA Male and the antenna is SMA Female. Usually the desired adapter is an SMA Female to SMA Female to adapt another brand antenna. Or an SMA F to BNC F to connect the radio to a coax cable. These adapters are on eBay.

I think you want an SMA-F to SMA-F. The F will fit the radio and the other end will fit the antenna- I couldn't find the sex of the antenna for sure but I think it is a Male. Here is a link:
http://cgi.ebay.com/BNC-SMA-F-SMA-F-Radio-Antenna-Adapter-Kenwood-Cable-/300442149781?cmd=ViewItem&pt=LH_DefaultDomain_0&hash=item45f3bf6395
You might consider using a BNC antenna and this adapter which is very robust on the radio:
http://cgi.ebay.com/SMA-BNC-SMA-F-BNC-F-adapter-PX-777-PX-888-/180440892586?cmd=ViewItem&pt=LH_DefaultDomain_0&hash=item2a031d84aa

I think this is a necessary feature for Land Mobile Radio use. The KG-UVD1P is Part 90 Approved and such use requires that the user not be able to change the radio setup- quite different from Ham use.

I hope I am asking this right.

I live in an area that has quite a few active repeaters. If I just want to hear the traffic on either A or B without the other coming on is there a way to turn off the dual watch? That way I could just monitor the one frequency.

Also, what is the purpose of Menu 13?

Thanks,
Jim

I have just bought a speaker mic off ebay for around 4$, can anyone tell me if this is a good mic: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&Item=270612725740&Category=58352&_trkparms=algo%3DLVI%26its%3DI%26otn%3D2

Thanks

I have the same mic and get good audio reports. Can't beat the price. However my favorite for regular use is
http://cgi.ebay.com/Earpiece-Kenwood-TK-3107-Puxing-Linton-Wouxun-019-/170414724213?cmd=ViewItem&pt=AU_Electronics_Radio_Equipment&hash=item27ad825475
Use it for AMSAT.

Press TDR and UVD1 shows the off channel.
Menu 13 is Busy Channel Lock- If On, you can't Transmit over receive traffic.

That $4 eBay unit looks exactly like one I bought somewhere else on eBay. Mine works OK. The speaker in all of the cheap Speaker/Mics is very small and not ideal for my bad hearing. I bet it works for you if you have good ears. I just bought a $50 heavy duty Pryme SPM-2101 Speaker/Mic which is larger and has a better quality speaker-lots more $, but I can hear better with it.

I hope I am asking this right.

I live in an area that has quite a few active repeaters. If I just want to hear the traffic on either A or B without the other coming on is there a way to turn off the dual watch? That way I could just monitor the one frequency.

Also, what is the purpose of Menu 13?

Thanks,
Jim

1805. Software Programming Questions

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-03 22:58:32 UTC
From: Barry A. Baines
Topic: 1805 Message: 1805

After purchasing a Wouxun at Dayton, I've finally had an opportunity to program the radio using the USB cable. I downloaded the latest version of the programming software (1.15) and have some questions about configuration. If there is a document that explains the options found in the programming software, please advise where I may find it. I didn't see anything in the files section, but I am may have overlooked it.

Questions regarding the 'Optional Functions' page:

1. Under Scan Mode, there are three options (Time, Carrier wave, Search). Am I correct to presume that they correlate to 'TO', 'CO', and 'SE' under Menu 19 of the radio?

2. One can select a 'Priority Channel', meaning a stored channel number. If a channel is entered, does the radio immediately go into 'Priority Mode', or must it be selected on the radio? If it must be selected, what Menu option activates it? Does priority channel function in VFO mode, memory mode, or both?

3. What is ANI-ID Transmit?

4. If I select 'Channel + Name' under 'Channel Display Way' and program the radio, it will change the display to show the name stored in "Ch-Name' as the radio reboots in 'memory mode'. However, if I subsequently switch from memory mode to VFO mode on the HT by using the Menu+TDR buttons and then return back to the memory mode, the radio no longer displays 'Ch-Name' but 'Ch-Number'. I have to go to Menu 21 to reselect 'Name' once again. Indeed, if I subsequently change to VFO again and then return to memory mode, I have to again reconfigure the radio for 'Ch-Name'.

Is there any way to force the radio to ALWAYS use 'Name' when switching to memory mode from VFO mode?

5. What is 'Mode Switch'? It appears to be a six digit value, but I have no idea what it is provides.

6. From a practical point of view, does it make sense to select 'Minus-Shift' or 'Plus-Shift' under SFT-D, which is used in VFO mode? Given that repeaters shift from '-600' to '+ 600' depending upon the frequency used (e.g. repeaters in the US below 147.00 MHz use '-' and repeaters above 147.00 MHz use '+'), does this provide any real benefit if shifting to a VFO frequency that may not match the offset of what has been programmed?

Under the Channel Message screen:

1. Is there a way to use anything other than letters or numbers under 'CH-Name' (e.g. '-', '/')?

2. What is DCS? I am familiar with CTCSS but am not familiar with DCS.

Under the Key Set Screen:

1. The PF1 key may be 'programmed', including selecting 'Scan'. If this option is selected, is there any difference between the 'scan' under PF1 and the 'Scan' on the keypad?

2. The PF1 key may also be programmed to select the 'SOS-CH'; that is, a channel used for presumably sending an emergency 'Wu Wu'. How does one select the actual channel/ frequency to be used for these transmissions?

Again, if there documentation that goes into detail about about the programming software, please advise and I'll dig deeper.

Lastly, are there any developments regarding other programming software packages designed for the Wouxun other than what is available from the radio's manufacturer?

Thanks,

Barry Baines, WD4ASW
Westborough, MA

From: jwheatleyus
Topic: 1805 Message: 1807

Long answer follows. Most of this is in the manual but you must dig for it.
1. Under Scan Mode, there are three options (Time, Carrier wave, Search). Am I correct to presume that they correlate to 'TO', 'CO', and 'SE' under Menu 19 of the radio?
YES
>
> 2. One can select a 'Priority Channel', meaning a stored channel number. If a channel is entered, does the radio immediately go into 'Priority Mode', or must it be selected on the radio? If it must be selected, what Menu option activates it? Does priority channel function in VFO mode, memory mode, or both?
When scanning, the Priority Channel is scanned more often. If Ch1 ia Priority, scan sequence would be Ch1,Ch3,Ch1,Ch4,Ch1,CH6,Ch1,Ch8
>
> 3. What is ANI-ID Transmit?
IDs the radio- sort of like Called ID
>
> 4. If I select 'Channel + Name' under 'Channel Display Way' and program the radio, it will change the display to show the name stored in "Ch-Name' as the radio reboots in 'memory mode'. However, if I subsequently switch from memory mode to VFO mode on the HT by using the Menu+TDR buttons and then return back to the memory mode, the radio no longer displays 'Ch-Name' but 'Ch-Number'. >
> Is there any way to force the radio to ALWAYS use 'Name' when switching to memory mode from VFO mode?
NO
>
> 5. What is 'Mode Switch'? It appears to be a six digit value, but I have no idea what it is provides.
Working Mode means Name, Freq, Ch No, or Ch Freq
>
> 6. From a practical point of view, does it make sense to select 'Minus-Shift' or 'Plus-Shift' under SFT-D, which is used in VFO mode? Given that repeaters shift from '-600' to '+ 600' depending upon the frequency used (e.g. repeaters in the US below 147.00 MHz use '-' and repeaters above 147.00 MHz use '+'), does this provide any real benefit if shifting to a VFO frequency that may not match the offset of what has been programmed?
For working Repeaters, I think it is easier to set them up via software. 70cm Repeaters may be either + or - offset, FYI
>
>
> Under the Channel Message screen:
>
> 1. Is there a way to use anything other than letters or numbers under 'CH-Name' (e.g. '-', '/')?
NO

>
> 2. What is DCS? I am familiar with CTCSS but am not familiar with DCS.
Digital Coded Squelch- similar end result as CTCSS
>
> Under the Key Set Screen:
>
> 1. The PF1 key may be 'programmed', including selecting 'Scan'. If this option is selected, is there any difference between the 'scan' under PF1 and the 'Scan' on the keypad?
NO- Scan is scan. Software is only way to tell a channel to scan
>
> 2. The PF1 key may also be programmed to select the 'SOS-CH'; that is, a channel used for presumably sending an emergency 'Wu Wu'. How does one select the actual channel/ frequency to be used for these transmissions?
Don't know the answer- I'm afraid to key it up in WuWu mode on our state wide repeater net
>
>
>
> Again, if there documentation that goes into detail about about the programming software, please advise and I'll dig deeper.
Most is buried in the manual-DIG
>
> Lastly, are there any developments regarding other programming software packages designed for the Wouxun other than what is available from the radio's manufacturer?
None that I am aware of

Given that repeaters shift from '-600' to '+ 600' depending upon the frequency used (e.g. repeaters in the US below 147.00 MHz use '-' and repeaters above 147.00 MHz use '+'), does this provide any real benefit if shifting to a VFO frequency that may not match the offset of what has been programmed?

From: Michael
Topic: 1805 Message: 1808

I have found that the PF1 key programmed as scan is better, as the scan button on the keypad is also the reverse repeater function & to scan you have to hold it down much longer to induce scan, I don't use the scan that often as I find it quite awkward to use as it is not easy to skip busy channels etc

In regards "WuWu" mode, I have tested it on a simplex frequency & it simply transmits a alarm siren over whatever frequency you have as main at the time, with the TX & RX lights alternating, great party trick!

When set and active, this will send a series of DTMF tones. I really do not know the purpose, as these radios will not receive the tones and display this "caller ID" on the display.

Perhaps Ed can asks his Wouxun contacts for more info. I cannot see any use whatsoever for this function, either in amateur or commercial use, since no other Wouxun can receive and use this "caller ID"

The ANI-ID can be decoded by a fancy base system thus allowing the dispatcher to know who is calling. This is a very simple use of ANI capabilities in a fancy communications system. Not very useful for Hams.

From: David A. Behar
Topic: 1805 Message: 1811

Regarding the ANI-ID function, here is how I think it would be used...

As you mentioned, the handheld radios can only be configured to transmit the ANI tones. But (for example) a dispatcher could have a base station equipped with a DTMF decoder, so the person who is transmitting can be immediately identified.

Or for any application where recordings are made of channel traffic (e.g., public safety, or train dispatch, etc.), if a recording needed to be reviewed later it can be made clear who was talking.

David

Date: 2010-08-04 02:45:30 UTC
From: Kendrik
Topic: 1812 Message: 1812

For some reason im not able to hear the DTMF through my speaker. I did change some setting today and before then i could hear it and now i cant. Any help would be appreciated.

Thanks

1813. 6 bay charger anyone know cost and where to buy?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-04 02:46:29 UTC
From: david_wagner41
Topic: 1813 Message: 1813

Looking to see how much it costs and if its available even (cant find it anywhere other than WOUXUN site).

Eventually want to get a bunch of these and prefer one charger for our house.

My goal is to set up a repeater at the house and use the radios in the cars and other family members who live in 10 mile radius. When there are blackouts etc the regular phones and cell phones are sometimes down and some family members have medical issues etc or are just getting up in age and would like a backup communication system. Just need to keep the cost down and these radios seem pretty good for the price (only had one a few days so far)

Thanks for any information etc.

Ok.. makes sense... I've heard law enforcement here use DTMF ID (but tones were much faster) Still would be better if WE could use it :)

1828. Charger Just blinks for split second and that's it

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-05 03:04:48 UTC
From: razorseal
Topic: 1828 Message: 1828

I just got my UVD1P in the mail from HK today and when I plug it into the charger it blinks very quickly (red) and then nothing happens. I have these ears however that can hear very high pitch noises though, and I can actually hear the charger doing something (charging it perhaps, I don't know) it's been plugged in for about 20 mins now and no light will stay steady. All I saw was the quick blink of the red light and that's it...

Any help? :(

Email the seller now as it is daytime there now. I would not leave it plugged in and unattended.

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-05 03:31:59 UTC
From: Durgadas Shenoy
Topic: 1828 Message: 1830

Hi All,
I am getting delivery of this HT.
1) When you insert the battery into charger the RED indicator turns ON this means the battery is charging when the Battery is full the GREEN indicator turns on
2) When you insert the exhausted battery pack into the chaerger, the pre-charger, charger the battery pack in trickle charge mode. meanwhile the RED Light flashes and this will last for 10 to 20mins, then the charger goes into normal charging mode with RED Light on and when the battery is full the GREEN Light turns on
3) This charger, charges the exhausted battery in trickle mode to protect the Li-ion Battery
This is what it is mentioned in the user manual

Regards

Shenoy

1832. R and S on the screen

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-05 04:08:14 UTC
From: razorseal
Topic: 1832 Message: 1832

What are they?

R comes up if I press * real quick (it scans if I hold)

S I'm not too sure...

and is there a way to tell which frequency/channel is receiving the transmission?

1833. Re: R and S on the screen

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-05 04:41:51 UTC
From: Michael
Topic: 1832 Message: 1833

"R" is for "reverse" to check the input of a repeater pair & "S" is for scan which I find a bit unwieldy to get it scanning, so I set the PF1 button on the side to be the scan button.

As for determining which frequency, you can't unfortunately & my Yaesu FT-470 is the same albeit a bit worse because it receives 2 bands at the same time, the Wouxun at least is 1st in first receiver.

Where the ANI-ID Transmit is and under "Set Sidetone" it has to be "key Sidetone" when i went messing with the setting i had put this to "off" and thats why i was not hearing it through the speaker.

Be VERY careful when you put the radio into the charger. There are two groves in the battery that mate with ridges in the charger base. You can actually remove the battery from the radio and it will lock into the charger base using the groves in the battery. It is very easy to put the radio into the charger and miss the groves- at least that is true with mine.

Confirm that - I found it tricky to mate the charger properly until I got the knack. You should be almost able to let it go in by its own weight - or else you are probably mis-aligning it, if so remove and try again. Don't push hard!

If your battery voltage is increasing (as shown by the radio power-up sequence) in the charger, then you have a charger problem - no question!

Unfortunately it's going to take around 3 weeks if you have to ship it back to the Far East and return - plus any time it takes for them to verify/rectify the problem or replace it. This the price we pay for getting our gear cheaper from the Far East - Unless you bought it from Ed of course!

Maybe if it's ex-Far East, you may prefer to have a look inside yourself, and be ready to scrap it and buy a replacement if you can't fix it. That would be a faster route.

If you find it is defective, you have a couple options.
1. Fir or repair it yourself (if qualified).
2. Return it to be evaluated/repaired.
3. Purchase a replacement.

Fixing a broken appliance - especially a piece of radio equipment - is often beyond the scope of most consumers and can be a safety hazard. A fire is not worh the questionable fix.

Returning the item to the "Far East" will cost you more just in shipping BOTH ways than the item is valued. I don't stock the simple desk charger that comes with the radio because of just that - it comes with the radio. I do however, have the dual charger available that will charge the radio battery AND the spare battery all my customers receive during the original purchase.

The dual charger is $25 and simply a headache saver if your charger somehow "leaves town" on you. Be smart, speak to your dealer before you take any action.

Wise words

I'd (if I was in USA) buy the dual charger from Ed. You'd probably have it in a few days. In the same situation in UK I'd buy one from ML&S here!

(although, being a ham, I'd have a go at checking the duff one first - we are or should be "hams", not "consumers" - the latter are CBers - we did after all pass an exam on radio electronics!)

Interesting note on the Nagoya NA771 antenna for the Wouxun. Maybe just me but I had to trim a full 1/8 inch off of the base to get it to screw down far enough to make a good contact to the radio.

I noticed right away that it the SMA female looked very shallow and when I was unable to catch more that a few threads and did a quick weak station check confirmed that it was not making contact.

Very nice antenna though. Good quality and every bit as good as the stock in receive. Hoping its better during transmit but haven't really checked that yet.

FYI...K2TJr - Ted

One of the first things I did was to put on my Diamond RH77CA witch has a nice 19" counter poise attatched via a hose clamp. I have found that this antenna which I have used on multiple radios is one of the best setups for an HT. The only issue that I seem to find with this on the Wouxun is that my counterpoise wire makes this thing a bit hard to set up on my desk. After doing some research I am thinking about trying the Nagoya NA771 with a thinner counterpoise wire and was wondering if anyone else here was running a setup like that and how well it works.

You can tell which band the signal is on, but it isn't easy. A small 'S' appears top right on the screen when the active band is not the selected band. For example, if the Arrow is on Band A and a signal is received on Band B, then the 'S' will appear

Radio Shack Part # 278-0013 is available at most stores. It costs about 6.99 or so. Worked for me.

Great! I was wondering why it was randomly popping up when I was receiving a signal from the bands. It all makes sense now, thanks!

So i found the problem... the LED was loose! I just tapped on it and it works! Easy fix... . But the accessories are so cheap I might justt the dual charger with hicap battery anyways!

Those chargers are very figity to get the radio into as was stated before. It can take me ages to get it in properly but just take care to get it into the grooves and it will eventually happen. It is not a great setup but not really a problem in relation to the price.

I gave you a dumb answer- sorry about that. The search feature is not really very useful for finding repeater tones because most repeaters only use tones on the receive side and don't transmit a tone. As a result, there is not signal to monitor and scan for tones. If you are patient, just start trying tones sequentially. You will know you are on the correct tone when the repeater hears you-ie you hear a squelch tail. Other alternative is to get the ARRL Repeater Directory, or Google "Repeaters town name" for example.

I'm not sure I agree with your statement regarding repeater tones. However, the way to search for a repeater tone is to use the "offset" frequency when searching for the tone. The problem with this procedure is that you must be within range of the transmitting station to capture the signal to decipher it.

This is why some repeater owners (like myself) have split tones meaning an encode different from the decode in the repeater. It helps eliminate intentional interferrence.

1853. Speaker out on HT

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-07 20:56:47 UTC
From: pfarcon
Topic: 1853 Message: 1853

I have been using my Wouxun KG-UVD1P for receive downlink on my satellite setup. I am looking to put a pair of headphones and a line out to a recorder so that when I transmit I don't cause feedback on the receive end. I have the splitter, the headphones, and a shielded stereo cable but then realized that the other end of the splitter is 3.5 mm and not 2.5 mm. I went ahead and bought an adapter cable from Radio Shack to step down to 2.5 mm but when I plug it in the audio out of the HT is muted but nothing is heard at the headphone side. I have tried the whole splitter setup on another HT with 3.5 mm jack for speaker/headset and all works fine. Is there a setting I am missing? Is there a specific adapter cable I should be using instead? Any help would be greatly appreciated.

The other connection on the 2.5mm stereo jack on the HT is the one the
PC programming cable uses to program the rig. Your RS adaptor might be
trying to bring that connection into play if it is a stereo adaptor, Pat.

Thanks all for the information. While I was outside trying to work another pass this afternoon I noticed that at the bottom of the Wouxun speaker microphone, as is common on many speaker microphones, there is a jack for audio out. It turns out that the jack there is a 3.5mm jack and works fine without the RS stereo adapter. Now I will try it tomorrow for the full test and try not to get myself all tangled up in the every growing cabling of this "portable" satellite station. LOL!

Hello,
I have a problem with the Wouxun Kg Uvd1
In 2 m band after 4-10 min TX and Rx transceiver is freezing.
Keypad and keys works but I cannot receive and transmitted any
signal.In 70 cm band radio works very well.

I suspect some problems with software because sometimes when I try to
change
working mode, the transceiver reboot. In is possibile to reflash the
firmaware?

Can you help me?

The Mic that I got is a large Heavy Duty mic. With Excellent Audio reports. And a lot cheaper that $50. It cost me $22 shipped. I got it in 3 days.

Is this one made out of some cheap plastic?

1864. Alternate Wouxun Programming Software -- Geek Wanted!

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-09 22:06:55 UTC
From: David A. Behar
Topic: 1770 Message: 1864

Hi friends,

Some of us have mused about having another (perhaps better) way to program the KG-UVD1P radio. Toward that end, I have done a bit of research.

First, I think I have identified in the *.tw file where every programmable parameter is located (at least the ones that can be modified from the Wouxun programming software), and how it is coded.

Next, I have used a serial-port monitoring utility to monitor the information exchange between the Wouxun programming software and the radio, and I have identified the application-layer protocol that is used by the programming software to program the radio.

My immediate goal is to just set up an Excel spreadsheet that can be used to program the radio, and then find a reasonable way to share it with whomever is interested. Since I am really busy with my business and a few other things, I don't think I can afford the time to provide support, so I was thinking that once I have this working I would just turn it over to somebody who is interested in helping people use it... so perhaps soon I'll be ready for a volunteer. And since I would not hide or protect anything in the spreadsheet, it could be a nice starting point for anybody who wants to program something more sophisticated, or easier to use, or whatever.

However, there is one technical issue that I have not overcome... perhaps because my computer science and software engineering training and experience have overwhelmingly involved projects where there is not much messing around with things such as software drivers, the intricacies of comm ports, etc... I am able to clearly see (and have fully analyzed) the information exchange I can see between the computer and the radio using a serial-port monotoring utility, but when I try to send the same stuff to the port using a couple of different methods, the radio does not respond.

I am guessing that anybody who has dealt to any extend with comm port stuff will figure this out in a jiffy... so I'm wondering if there are any qualified volunteers. If you think you'd like to try to help with this serial port issue, just send a private message and I'll show you what I've figured out. Thanks!

David

1865. MURS is it possable with this radio?

From: David A. Behar
Topic: 1770 Message: 1866

If there are any VBA programmers around, see if you can get the following working: Send the string HiWOUXUN to the radio, followed by 0x02 (i.e., Hex 02). If you do it right, the radio should respond with 0x02.

Here is a website with programming info:http://www.thescarms.com/vbasic/commio.aspx.

Once somebody can get this part working, I think I can pretty quickly have a simple Excel spreadsheet put together that we can use to program our radios.

David

Yes, you just have to get the unlock software and open up the transmit range to 138-174 (or anyway, raise the upper limit to 155.something).

Yes, it is possible and legal IF you do it LOW power.
MURS is limited to 2 watts so you want to program low power so as to not be out of "friendship" with Uncle Charlie.

I can't think of why you might be out of band (range).

Hi all,
I just saw these videos on youtube:

http://bit.ly/c0GxJZ

http://bit.ly/9i4auF

I think the person doing the video is probably wrong claiming TX actually works on the frequencies he is showing even though it looks like it works on the display (the reason why it won't work has been explained many times on the group). But what I am interested in is the firwmare versions, does anyone know how to identify which version a radio i using (J01, J02, J03, J04?)
Also provided such firmware versions really exist, is it possible to upgrade from one version to another one?
Maybe some of you guys who are working directly with Wouxun have more info on this?
Any info much appreciated!
73,

/JM

1875. Re: [Wouxun_KG-UVD1] MURS is it possable with this radio?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-10 19:53:34 UTC
From: David A. Behar
Topic: 1865 Message: 1875

Here is a page with a link to the unlock software (which lets you change transmit and receive limits on the radio): http://www.worldwidedx.com/radio-radio-related-modifications/62063-wouxun-kg-uvd1p-software-mod.html

The MURS frequencies are:
Ch. 1: 151.820 mHz, narrow deviation (11.25 kHz authorized bandwidth)
Ch. 2: 151.880 mHz, narrow deviation
Ch. 3: 151.940 mHz, narrow deviation
Ch. 4: 154.570 mHz, wide deviation (20.00 kHz authorized bandwidth)
Ch. 5: 154.600 mHz, wide deviation
Legal note: Radios "certificated" under a different part (e.g., Part 90) as of Nov 12, 2002, need not be certificated for Part 95 Subpart J. Otherwise, the radio must be certificated under Part 95 Subpart J. Maximum transmitter power output is 2 watts. (http://wireless.fcc.gov/services/index.htm?job=service_home&id=multi_use)

Interestingly, the FCC will certify certain "TX combo devices", i.e., a device certificated for use in more than one service. E.g., FRS/GMRS combos have been approved many times. MURS rules explicitly state that MURS combos will not be certificated. Interesting info about combo radio certification is at http://www.fcc.gov/oet/ea/presentations/files/oct07/Oct_07-Licensed_Devices&Recent_Interps-SD.pdf.

Also, the KG-UVD1P is not certificated for Part 95 Subpart A (GMRS)... many radios are jointly certificated for Part 90 and for Part 95A, so I wish Wouxun would spend the extra few bucks (it's not expensive) to and also apply for Part 95A certification. (Dealers, please contact Wouxun and ask them to do this!)

If you are the kind of person who will not drive 61 mph in a 60 mph zone (which is strictly illegal, by the way), then using the Wouxun KG-UVD1P on MURS or GMRS frequencies might not be for you.

David

Legal note: Radios "certificated" under a different part (e.g., Part 90) as of Nov 12, 2002, need not be certificated for Part 95 Subpart J. Otherwise, the radio must be certificated under Part 95 Subpart J. Maximum transmitter power output is 2 watts.
(http://wireless.fcc.gov/services/index.htm?job=service_home&id=multi_use)

So then the Wouxuns ARE legal... My mistake... of course both my radios will now be programmed for said service.

If you are the kind of person who will not drive 61 mph in a 60 mph zone (which is strictly illegal, by the way), then using the Wouxun KG-UVD1P on MURS or GMRS

frequencies might not be for you.

Didn't you just say they are legal for MURS? I'm confused

part of the problem is this

The MURS frequencies are:
2w
Ch. 1: 151.820 mHz, narrow deviation (11.25 kHz authorized bandwidth)
Ch. 2: 151.880 mHz, narrow deviation
Ch. 3: 151.940 mHz, narrow deviation
Ch. 4: 154.570 mHz, wide deviation (20.00 kHz authorized bandwidth)
Ch. 5: 154.600 mHz, wide deviation

while the KG-UVD1p would be
1w
Ch. 1: 151.820 mHz, narrow deviation (12.5 kHz)
Ch. 2: 151.880 mHz, narrow deviation
Ch. 3: 151.940 mHz, narrow deviation
Ch. 4: 154.570 mHz, wide deviation (25.00 kHz)
Ch. 5: 154.600 mHz, wide deviation

Otherwise, the radio must be certificated under Part 95 Subpart J. Maximum transmitter power output is 2 watts. (http://wireless.fcc.gov/services/index.htm?job=service_home&id=multi_use)
>
> Interestingly, the FCC will certify certain "TX combo devices", i.e., a device certificated for use in more than one service. E.g., FRS/GMRS combos have been approved many times. MURS rules explicitly state that MURS combos will not be certificated. Interesting info about combo radio certification is at http://www.fcc.gov/oet/ea/presentations/files/oct07/Oct_07-Licensed_Devices&Recent_Interps-SD.pdf.
>
> Also, the KG-UVD1P is not certificated for Part 95 Subpart A (GMRS)... many radios are jointly certificated for Part 90 and for Part 95A, so I wish Wouxun would spend the extra few bucks (it's not expensive) to and also apply for Part 95A certification. (Dealers, please contact Wouxun and ask them to do this!)

Two watts is maximum power -- it's ok to use less :)

----- Original Message -----

part of the problem is this

The MURS frequencies are:
2w
Ch. 1: 151.820 mHz, narrow deviation (11.25 kHz authorized bandwidth)
* * * * * *

while the KG-UVD1p would be
1w
Ch. 1: 151.820 mHz, narrow deviation (12.5 kHz)
* * * * * * *

Hi friends,

The KG-UVD1P radio is not certificated for MURS use, but it will operate on those frequencies. If you were to use the radio on low power on MURS frequencies, I believe your emissions would be in compliance with MURS rules, but the fact that you are using a non-certificated radio would be non-compliant (i.e., a rule violation).

A radio which was certificated under another service (e.g., Part 90) on or before Nov 12, 2002 can be legally used on MURS frequencies, but Part 90 radios certificated after that date can't legally be used on MURS frequencies.

The FCC will not certify a radio for MURS if it can operate on any frequencies other than MURS frequencies using the normally accessible user controls. The FCC will not "dual-certify" a radio under both Part 95 Subpart J (MURS) and Part 90 (commercial/public safety/transportation/etc).

Interestingly, it appears from the FCC database that only 26 radios have been certificated for MURS, from only 15 manufacturers: ASE Telecom Co Ltd, CALSENSE, Columbia Telecommunications Group Inc, Dakota Alert, Garmin International Inc, H K Protech, Inc., Midland Radio Corporation, Motorola Inc, Putney Landing Enterprises, Inc., Raveon Technologies, Incorporated, Ritron Inc, Tait Electronics Limited, Telonics Inc, The Toro Company, and White Bear Technologies.

Furthermore, I believe some of these certificated radios are for applications other than voice communications.

David

Legal note: Radios "certificated" under a different part (e.g., Part 90) as of Nov 12, 2002, need not be certificated for Part 95 Subpart J. Otherwise, the radio must be certificated under Part 95 Subpart J. Maximum transmitter power output is 2 watts.
(http://wireless.fcc.gov/services/index.htm?job=service_home&id=multi_use)

So then the Wouxuns ARE legal... My mistake... of course both my radios will now be programmed for said service.

If you are the kind of person who will not drive 61 mph in a 60 mph zone (which is strictly illegal, by the way), then using the Wouxun KG-UVD1P on MURS or GMRS

frequencies might not be for you.

Didn't you just say they are legal for MURS? I'm confused

Yes you can use this radio on murs and don't worry about power restrictions since max power on murs is set to 50 watts and max power on this ht is 5 watts.

I have one of those "fits any mobile phone" holders that I'm going to try in the car when I get home from this trip. Maybe a "mini" coax tail to wrap down the side of the phone to the mag-mount's RG-59.

(And a speaker mic)

I have a GMC Envoy with a mount like the InDash made by PanaVise- www.panavise.com They make neat hidden mounts like this for many vehicles.
I made it wide enough to make room for the radio to clip on with the belt clip and the Speaker/Mic fits on the right side. I use velcro on the Mic and mount so the Mic slips off easily for talking.

1888. Programming "splinter" frequencies on KG-UV2D

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-11 18:09:24 UTC
From: jeffmarshall911
Topic: 1888 Message: 1888

Received the radio today from Ed and I'm mid-way through programming it using v1.15 of the software. The serial number starts with J08 (I've seen some threads of firmware versions FWIW).

I've set frequency steps to 5KHz and 6.25KHz but it still won't take any of the new US 'splinter' frequencies in VHF (see FCC Narrowband Mandate)

For example, 156.0675 is entered but the software changes it to 156.0650.

If I do it on the radio itself, the following occurs:
- In 6.25 KHz steps, the radio offers 156.06250, 156.06875, 156.07500 and so on.

- In 12.5 KHz steps, the radio offers 156.0625, 156.075, 156.0875 and so on.

I've got a large number of licensed frequencies that this radio cannot accept. I'm assuming there is an interpretation difference between US channel steps and non-US channel steps. Or gross user error.

Thoughts?

/Jeff

1889. Re: [Wouxun_KG-UVD1] Programming "splinter" frequencies on KG-UV2D

Date: 2010-08-11 19:30:03 UTC
From: David OConnor
Topic: 1888 Message: 1889

Jeff,

156.0675 requires a radio with a PLL Step Size of 1.25 KHz, 2.5 KHz or 7.5 KHz in order to accept that frequency. If you divide the frequency that you are trying to program by 5.0 KHz (.0050) or 6.25 KHz (.00625), or any other PLL Step Size, and get an answer that is NOT a whole number, the radio will not accept that frequency. If the answer is a whole number, an integer, it will go.

Regards,
Dave

156.0675 is not a multiple of either 6.25KHz or 5KHz (or any step size in the radio) which is why the radio won't accept that frequency. The frequencies it will accept must be exact multiples of the step size you have set. The frequency you are trying to install is an exact multiple of 3.125KHz so perhaps the FCC has chosen that as the frequency steps required.

In general, accommodating the VHF split of 15 kHz channels will require a 2.5 kHz step size. The channels will be spaced 7.5 kHz apart, but there is no guarantee that the "starting point" is at an integral number of mHz, and so the flexibility of 2.5 kHz step size is required.

David

the program was very bad about doing. it version 1.12 and earlier with 1.15 i have been able to program with it i have 155.8125 in mine it is working ok the software needs some work in many places . most radio programing software likes a lot to be desired includeing GE Motorola and Vertex

Try setting the vfo to a standard 6.25khz channel and see if it helps I think mine is set like that

Received the radio today from Ed and I'm mid-way through programming it using v1.15 of the software. The serial number starts with J08 (I've seen some threads of firmware versions FWIW).

I've set frequency steps to 5KHz and 6.25KHz but it still won't take any of the new US 'splinter' frequencies in VHF (see FCC Narrowband Mandate)

For example, 156.0675 is entered but the software changes it to 156.0650.

If I do it on the radio itself, the following occurs:

- In 6.25 KHz steps, the radio offers 156.06250, 156.06875, 156.07500 and so on.

- In 12.5 KHz steps, the radio offers 156.0625, 156.075, 156.0875 and so on.

I've got a large number of licensed frequencies that this radio cannot accept. I'm assuming there is an interpretation difference between US channel steps and non-US channel steps. Or gross user error.

Thoughts?

/Jeff

Yes you can use this radio on murs and don't worry about power restrictions since max power on murs is set to 50 watts and max power on this ht is 5 watts.Sent via BlackBerry from T-MobileFrom: "David A. Behar" <david271@gmail. com>

Subject: Re: [Wouxun_KG-UVD1] MURS is it possable with this radio?

Hi friends,

The KG-UVD1P radio is not certificated for
MURS use, but it will operate on those frequencies. If you were to use the
radio on low power on MURS frequencies, I believe your emissions would be in
compliance with MURS rules, but the fact that you are using a non-certificated
radio would be non-compliant (i.e., a rule violation).

A radio which was certificated under another
service (e.g., Part 90) on or before Nov 12, 2002 can be legally

used on MURS frequencies, but Part 90 radios certificated after that date can't legally be used on MURS frequencies.

The FCC will not certify a radio for MURS if it can operate on any frequencies other than MURS frequencies using the normally accessible user controls. The FCC will not "dual-certify" a radio under both Part 95 Subpart J (MURS) and Part 90 (commercial/ public safety/transportati on/etc).

Interestingly, it appears from the FCC database that only 26 radios have been certificated for MURS, from only 15 manufacturers: ASE Telecom Co Ltd, CALSENSE, Columbia Telecommunications Group Inc, Dakota Alert, Garmin International Inc, H K Protech, Inc., Midland Radio Corporation, Motorola Inc, Putney Landing Enterprises, Inc., Raveon Technologies, Incorporated, Ritron Inc, Tait Electronics Limited, Telonics Inc, The Toro Company, and White Bear Technologies.

Furthermore, I believe some of these certificated radios are for applications other than voice communications.

David

Legal note: Radios "certificated" under a different part (e.g., Part 90) as of Nov 12, 2002, need not be certificated for Part 95 Subpart J. Otherwise, the radio must be certificated under Part 95 Subpart J. Maximum transmitter power

output is 2 watts.
(http://wireless. fcc.gov/services /index.htm? job=service_ home&id=multi_use)

So
then the Wouxuns ARE legal... My mistake... of course both my radios will now

be programmed for said service.

If you are the kind of person who
will not drive 61 mph in a 60 mph zone (which
is strictly illegal, by the
way), then using the Wouxun KG-UVD1P on MURS or GMRS

frequencies might
not be for you.

Didn't you just say they are legal for MURS? I'm
confused

I've not opened up my radio (shame on me - I'm a Ham!) but why would you want to?

Saving the cost of an adapter? Surely not.
Losses in the adapter? This is a hand-held, hardly a DX machine.

Also, the body of the adapter adds just a little more mass/height to the radio, which is basically your ground plane. I've even though about bonding (clamp, solder, whatever) a wire about 19 inches long to the outer of my BNC adapter to make something that would be a bit more resonant.

Adrian,

Actually, I believe just the opposite. I have two HTs in front of me right now. If I wiggle the flex antenna side to side on my Wouxun with the SMA fitting I find it to be sturdy and cannot feel ANY wiggle at all while the other HT with a BNC antenna has definate wiggle to it. Thinking it might be the sntenna itself that has the sloppy fitting I tried a different antenna on the same radio. Slightly less wiggle so I guess it is a function of the degree of allowance for twist in the antenna design that is responsible.

I find little need for a BNC on an HT unless you want to attach an external antenna. Using it for simply another flex "rubber ducky" antenna you believe will give you additional gain simply doesn't add up to me. Look, we're talking about an HT! Why risk signal loss with additional connections if you don't need to in hopes of getting more gain from a different flex antenna? I recommend you stay with the SMA the Wouxun came with. It is reliable and does an excellent job. My favorite saying is "If it ain't broke then don't fix it!"

Having said that, I realize you probably wish to use an Arrow for your sat ops and that is simply connecting an external antenna much like you would do for a vehicle's mag mount. I get it. You are pretty much stuck using an adapter in this case for your purpose. I really don't think you want to play doctor and operate on your HT to change the SMA to a BNC. That would be a nightmare in my book designwise. So, we're back to evaluating adapters.

Since you mention you are a sat op, have you considered the recommendation from K7LCS? He recommends the BNC/SMA adapter by Gulyas. The website describing this antenna is: <http://web.me.com/clintbradford/k6lcs/Docs_files/gulyas-09b.pdf>.
It appears to be a good, sturdy adapter and certainly has a nice appearance. What I really don't like is the price. He charges $11.95 for the adapter PLUS $2 shipping PLUS $1 Paypal trans fee for a total of $14.95. I don't know but $15 for this adapter seems excessive. My price is $8 and that is with FREE shipping and NO CHARGE for Paypal. I give one to every radio order I handle as SOP.

I think you are stuck but it's a good thing. The stress on the HT itself and the BNC adapter is minimal with just your light coax to your Arrow or other antenna. I say go for it and happy satcoms.

1910. Extended frequency coverage

Yahoo group: Wouxun_Radios (2009 — 2010)

Hi all,
Yet another post about extended frequency coverage...
According to this person (see the comments): http://bit.ly/cZnLeQ it seems at least the versions of the KG-UVD1P running firmware version J04 and J06 can indeed transmit on 220Mhz band and many other frequencies... I don't have any means to verify this claim but would be much interested if anyone has the ability to do so.
He claims his is using a new software unlock written by some people in Poland, different from the xxx-unlock.exe we all know about. If anyone has access to this software it would be interesting to send a copy to the group.
Also I would appreciate any info concerning a changelog of the different firmware versions (J03, J04, J06)... I wonder if the cracking noise of the broadcast FM receive has been fixed in newer firmware versions?

Regards,

/JM

How do you tell what Firmware Version is in the radio?
I unlocked mine and programmed frequencies out of range with the following results.
The lowest I could get the VCO to lock on was 410.000 Mhz
The power was down to 3.1 watts and the rx Sens. was down to -124dbm
The highest it would go was 475 Mhz with 3.05 watts out and rx sens. of -118dbm.
Conclusion..... My radio works fine from 420 to 470 Mhz and the performance degrades rapidly when you try to use it out of it's advertised range.
If someone wants to send me this "magic" polish unlock software. I'll be wiling to try again. I've got the test equipment to verify if it "really" works.

Ken

I can't take the producer of that video-clip seriously.

He starts off by referring to a simple re-badging job as a clone.
It is not a clone, it's been made at the same factory as all of the others UVD1s. The only difference is the name badges which have been attached. I understand Wouxun offer a name change to those companies who pay for it. Certainly another German company - Albrecht - market a re-badged KG-UVD1P, the Albrecht DB270.

He then seems unable to decide whether all of this additional frequency coverage is down to new "polish" 'firmware' or 'software'
There is a difference guys.

I've tried opening up various UVD1s to cover 220 etc. It doesn't work. Yes you can make the display show various frequencies, you can even make the little TX light come on and the RF bar in the frequency display, show it's transmitting. But that's all it does. Show.

Listening on a scanner, it's obvious nothing is being transmitted. Putting a meter in line with the antenna, shows no RF output and measuring the current being drawn shows no significant increase between RX and TX.

Trust me on this..... It's not transmitting.

Hi,

I've had similar results. I open it up using the unlock software but nothing is transmitted when pushing the xmit button. I have two KG-UDV1P ht's and didn't hear it on the other, so I tried to receive it on my Kenwood ht and then my V8000 nothing. I didn't have any test equipment but could not hear anything on 3 different radios. So until I hear otherwise I have to say it does NOT and will NOT transmit out of the factory settings. It probably can be INTERNALLY modded but I'm not going to try.

Hello,
I have used a Kenwood SM-34 and a MFJ-296K both have the Kenwood pin out and work with the Wouxun ht. Both are built well and I've had both several years. I've used them for several years and have loaned them out and never had one malfunction or even had a broken wire. I guess you get what you pay for.

My radio is 136-174 and 420-520 version. Unlocked it to test. NO Tx output above 174 when unlocked to 220. Starts at about half power at 410 when unlocked down to 220. It appears that tuning or firmware will not allow use much out of the factory range.

Hi all,
Yet another post about extended frequency coverage...
According to this person (see the comments): http://bit.ly/cZnLeQ it seems at least the versions of the KG-UVD1P running firmware version J04 and J06 can indeed transmit on 220Mhz band and many other frequencies... I don't have any means to verify this claim but would be much interested if anyone has the ability to do so.
He claims his is using a new software unlock written by some people in Poland, different from the xxx-unlock.exe we all know about. If anyone has access to this software it would be interesting to send a copy to the group.
Also I would appreciate any info concerning a changelog of the different firmware versions (J03, J04, J06)... I wonder if
the cracking noise of the broadcast FM receive has been fixed in newer firmware versions?

Regards,

/JM

Hi Ken,

I think you can see the version of the firmware of your HT if you remove the battery. You should find a number like J0X-XXXX.
The J0X seems to correspond to the firmware version of the HT.

JM

How do you tell what Firmware Version is in the radio?
I unlocked mine and programmed frequencies out of range with the following results.
The lowest I could get the VCO to lock on was 410.000 Mhz
The power was down to 3.1 watts and the rx Sens. was down to -124dbm
The highest it would go was 475 Mhz with 3.05 watts out and rx sens. of -118dbm.
Conclusion..... My radio works fine from 420 to 470 Mhz and the performance degrades rapidly when you try to use it out of it's advertised range.
If someone wants to send me this "magic" polish unlock software. I'll be wiling to try again. I've got the test equipment to verify if it "really" works.

Thanks, nothing starting with "J" on the label.The serial number is in that format but it doesn't start with "J", it starts with an "I" I07-XXXX.
BTW my radio is one of the first "P" models and is a little over one year old.

1928. Serial Number - was Extended Frequency Coverage

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-17 12:50:11 UTC
From: wouxunus
Topic: 1928 Message: 1928

The serial number for the KG-UVD1P & KG-UVD2 have nothing to do with any firmware or software revisions. It is the date of manufacture and serial number. J06 means the manufacture year and month. J refers to 2010, 06 refers to June, and the next 4 numbers are the manufacture number of each model. Single band serial numbers are a little different as each model has different versions, like C2J1-xxxx, C2 refers to the version, and the other numbers are the same as with dual band models.

Ed,
With the programing software are we able to update the firmware in our radios? I know that my radio was manufactured in October 2009 as the begining of the S/N is I10. If we are able to update the firm ware how would we get the new firmware, and will the programing software allow us to do this update?

Thanks,

Matt

Subject: [Wouxun_KG-UVD1] Serial Number - was Extended Frequency Coverage

Date: Tuesday, August 17, 2010, 5:50 AM

The serial number for the KG-UVD1P & KG-UVD2 have nothing to do with any firmware or software revisions. It is the date of manufacture and serial number. J06 means the manufacture year and month. J refers to 2010, 06 refers to June, and the next 4 numbers are the manufacture number of each model. Single band serial numbers are a little different as each model has different versions, like C2J1-xxxx, C2 refers to the version, and the other numbers are the same as with dual band models.

Guys I never said there was any firmware or software upgrades. I simply pointed out what the numbers in the serial number stood for. Even the recent Menu 21 change made to radios in my last order were done on the chip level. When I asked if the change could be applied to older models, I was told no. I expect if Wouxun had upgrades that could be applied by owners, they would say so.

From: Jim
Topic: 1932 Message: 1932

Dose anyone have a non-working charger base for the KG-UVD1 radio? I have a project I want to try and if it works I will share it with the group. Jim Rogers N5VGQ

1933. KG-UVD1P internal memory and firmware updates

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-17 20:21:53 UTC
From: David A. Behar
Topic: 1928 Message: 1933

Hi friends,

I have analyzed the structure of the "tw" programming file, and I have also analyzed the communications protocol between a computer and the radio. I have also read the KG-UVD1P service manual. Based on that analysis, I believe (but can't be 100% certain) that it would be possible to perform a firmware update, even though I understand the company denies this. I will explain how I reached this conclusion.

First, the communications protocol between a computer and the radio -- whether downloading programming to the radio or uploading programming from the radio -- consists almost totally of "Read" and "Write" commands. Each command includes a single letter (byte) -- "R" for Read and "W" for Write; and then a two-byte address; and then a length of the data block. For example, the data communications is usually 64 bytes at a time.

When you download data to the radio, all you are downloading is 128 16-byte channel records for channels 1 to 128; 128 16-byte label records for channels 1 to 128; 2 16-byte channel records for VFO A and VFO B; and another 64 bytes of information for general radio settings.

By the way, the program which reads and writes band limits for transmitting and receiving uses the identical protocol, and there is just a specific address in the radio memory where this information is stored.

According the the service manual (mine is marked Model KG-UVD1P, Version KG-UVD1-0905-V1), on page 13, under the heading "VII Memorizer Circuit", we see the following text:
The memorizer circuit is made up of CCPU (IC811) and EEPROM (U811).

The capacitance is 64k bits, including the handset controlling program by CPU and the operation function data.
Under this text appears a simple diagram showing a single CPU communicating with a single EEPROM.

Note that the "64k bits" is 8k bytes. The radio programming information takes up a bit over 4k bytes (a 16-byte channel record and a 16-byte label record for 128 channels, plus just a bit more memory for other radio configuration information), leaving a bit less than 4k bytes for the radio control program. Note that the manual indicates that both the radio data and also the control program are stored in this single EEPROM.

Since the radio-computer serial communications protocol seems to permit reading and writing to any address in the EEPROM, if a person were to know where to apply a patch it should be possible to update the firmware. In fact, a person could read the firmware from two versions of the radio and see exactly what the differences are. However, since the CPU is presumably accessing the EEPROM on a continuous basis -- including to run the serial data communications protocol -- in practice there would be a danger of modifying a portion of the data control program which is being used during the data transfer protocol. Therefore, experimenting with this would have a risk of corrupting the radio control program, rendering the radio unusable.

But if the radio control program in the EEPROM is written in a way that the communication code were segregated in one part of memory, then it should be possible for Wouxun to provide an updating program which would update firmware (but not mess with the data communications code).

David

1934. USA Selers of KG-UVD1P

I bought one of these and its pretty good for the money. The seller no longer answers my emails etc. I am looking for a USA seller because I have a few friends at work that want them and we are on a "buy local" (even though its made in China) kick.

One or two guys already gave up and bought from China and they came in about a week or so which is not bad and they were cheap (they bought a few at once and got a good price) but a few of us want to buy here in the USA if possible. We dont need the programming cables etc.

So who are the USA sellers and their websites?

PS they need to be the wide open version as a few are hams and GMRS and or Volunteer Firemen etc.

Thanks

Another vote of confidence for Ed. Not only will he sell you one with all the accessories you need, but his after-sales support is second to none. Not only through his participation on this list, but also with prompt, courteous, and thorough Emails to follow up any issue I've had or even any tiny question. Super fellow, would not hesitate to do business with Ed at wouxun.us again.

1939. Mike / Speaker connections to TNC (APRS)

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-18 18:26:41 UTC
From: StuN
Topic: 1939 Message: 1939

I'm trying to interface my rig to a CCW TNC for APRS. Bought a twin-plug-end-cable from Argent Data Systems in US but I'm a bit puzzled about the four wires at the other end of the cable. They appear to be connected to:
2.5mm body (outer)
2.5mm tip
3.5mm body (outer)
3.5mm ring (the connection in between the body and the tip)

The mike and speaker connections seem pretty straight-forward, but I'm a bit puzzled how to connect the PTT to what the TNC calls "PTT OUT" (short to ground to transmit??)

Can anyone assist please?

Geesh, this has been reported so many times. These have all been false positives. Nothing has ever proven any of these reports are actually true. I use Malwarebytes and avast anti virus. I keep them updated and they will warn me every time that I install/down load something. If you get the software from an unknown source then beware. If you get the software from the company web site it's not likely 99.9999999999% to be infected. This from my experience as a computer pro for 30+ years.
 YMMV

To key it you connect between the sleeve of the 2.5 and 3.5 plugs one is ground and the other is the key line I do not remember which one is which but the service manual is posted on this Group. The Ptt out should connect to one of outer sleeves check the manual for which one .

With due respect to Ed, there are TWO Ed's here on this server that are both dealers of Wouxun. This particular Ed appreciates and honors the other Ed for his professionalism and help to the group.

I bought one of these and its pretty good for the money. The seller no longer answers my emails etc. I am looking for a USA seller because I have a few friends at work that want them and we are on a "buy local" (even though its made in China) kick.

One or two guys already gave up and bought from China and they came in about a week or so which is not bad and they were cheap (they bought a few at once and got a good price) but a few of us want to buy here in the USA if possible. We dont need the programming cables etc.

So who are the USA sellers and their websites?

PS they need to be the wide open version as a few are hams and GMRS and or Volunteer Firemen etc.

Thanks

I am working on a website for my radio business. Should be done soon.
I have radio dealerships with two companies including Wouxun.
My other business is oil filters and my established website is www.FRANTZOIL.com .
I am located in the Upper Desert community of Pinon Hills (west of Victorville and close to Wrightwood and Phelan.)

1957. 222 MHz questions

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-19 19:49:37 UTC
From: Joe Krout
Topic: 1957 Message: 1957

Hi
There are a couple of things I am unclear on.

Is there a physical difference between the 222 MHz capable kg1's and the 440's?

Are the 2meter/222's rated at 5 Watts on each band? I know they are rated for 4 Watts on uhf(440)

Thanks
Joe. W0PWJ

Thanks!

Does this mean that you could use the unlock software to switch band coverage from 2 meter/222 to 2 meter /440, and back? How about 222/440?

I'll be ordering soon. Got to go crack the piggy bank!

Man, this comes up so often that there should be a notice sent out to any new member about it.

Joe: Externally the units appear identical. The boards or band filters or something inside are different. You can make it display a frequency in 222 and it will look like it's transmitting... but there will not actually be any RF and I don't think it'll even receive.

Hi,

Go to your printer setup and use landscape (horizontal) - it works fine with that. If it still runs off the page, set your page reduction down about 5% - that will allow for any margins on your printer. It really prints quite well. My printer prints all 3 sheets perfect landscape

Hope this helps,

Tom, N4GVK
Greensboro, NC

Keisha's statement is true and is obvious to anyone who attempts to print from this radio's program.What is troubling is that the manufacturer of this radio does not seem to understand the importance of having a complete printed record of the radio's memory especially for people engaged in emergency communications in the United States.Communicating the importance of this issue to the manufacturer is like pushing on the end of a wet noodle! No pun intended!The KG-UVD1P is a great radio, but its ultimate value is diminished (IMHO) because of this printing issue.Correction of this problem plus the addition of a 2.5 KHz PLL Step Size would make this radio a giant killer in the Part 90 world once the VHF High Band narrow-banding is totally in effect.
Respectfully,David

In portrait, it is only printed out the channels from 1-100, while in landscape, it can print out the channels from 1 to 128, but the far left column and the right column will be missed.

On a second reading of Keisha's message, I believe she has portrait and landscape modes reversed at least as I experience printing from that radio. I find that portrait prints all 128 memory channels but the left-most and right-most columns are omitted from the printout. In landscape printing, all columns are printed but only memory #'s 1-98 are printed. In both cases, the Decode and Encode columns are juxtaposed going from the program to the printed copy.
The manufacturer really needs to address these problems.

One must check the FCC type acceptance for this model.
I find it strange if it was granted for this type of service and it did not include the new "Narrow Band" capabilities I wonder how did the testing company (Florida) miss this?

2013 is getting close and it is my understanding that ALL new approvals MUST have the ability to program the step size to establish the frequencies???
Regards.

Date: 2010-08-20 19:19:37 UTC
From: David OConnor
Topic: 1888 Message: 1968

Dan,
155.8125 MHz can be programmed into a radio that has PLL Step Sizes if 12.5, 7.5, 6.25, 2.5 or 1.25 KHz. Since the KG-UVD1P has 6.25 and 12.5 KHz PLL Step Sizes available, one can program successfully the frequency you have noted.
The PLL Step Size dictates the smallest frequency interval or increment to which the radio can be tuned for both transmit and receive.
To determine if a given frequency can be programmed into a particular radio, divide your desired frequency by each of the available PLL Step Sizes that the radio has available. If the resulting answer for any of those PLL Steps is an integer or a whole number, the radio can be programmed successfully. If the answer has a decimal remainder, it cannot.
Respectfully,Dave

1970. Alternate Wouxun Programming Software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-20 19:53:38 UTC
From: David A. Behar
Topic: 1970 Message: 1970

Hi friends,

I have been experimenting with creating an alternate programming method for the Wouxun KG-VD1P.

So far I understand the layout of the "tw" file, and I understand the protocol for communications between the computer and the radio.

Yesterday, for the first time, I used VBA (Visual Basic for Applications -- software that comes free with Excel and other MS Office products) to actually modify data on the radio, and I was able to program a channel label (including putting a space in the label name). This is a big deal for me, because the last time I was really doing programming professionally full time was in the early 80s (and a lot has changed since then!). Since then I have done project management and analysis work, and some programming, but it has not been my main work.

What I plan to do first -- because it's easier -- is to just make an Excel spreadsheet that can be used to change all of the channel parameters in a "tw" file (xmit freq, rcv freq, tone squelch, power, modulation deviation, and channel label). Since this will be in Excel, it will be possible to copy, paste, sort, etc. in laying out channel parameters. With this strategy I won't need to write the code that communicates with the radio, since the standard programming software will be used to write the file to the radio.

Next, I will add in the other "global" parameters, like time-out, what the function button does, etc.

And finally, I might work on the code to directly communicate with the radio. I have had success reading and writing to the radio using VBA, but I would really like to collaborate with someone who is an experienced VBA programmer and who has some experience working with communications programming. Any volunteers?

David

Follow the wiring colors in the Argent Data Web Site.

This is from their Site:

All of our speaker mic cables should be wired as followed:

Red - Speaker
White - Mic
Blue - PTT (if used)
Black - Ground

I have been using this cable for a few months and I just followed the color code.

David,

I am sorry that I can't help with the programing end but if you could figure out a way for the radio to light the red LED when the secondary channel gets busy and the green only for the primary, you would be a hero.

Good luck in your endeavors.

☐

Hi friends,

I have been experimenting with creating an
alternate programming method for the Wouxun KG-VD1P.

So far I understand the layout of the "tw" file,
and I understand the protocol for communications between the computer and the
radio.

Yesterday, for the first time, I used VBA (Visual
Basic for Applications -- software that comes free with Excel and other MS
Office products) to actually modify data on the radio, and I was able to program
a channel label (including putting a space in the label name). This is a
big deal for me, because the last time I was really doing programming
professionally full time was in the early 80s (and a lot has changed since
then!). Since then I have done project management and analysis work, and
some programming, but it has not been my main work.

What I plan to do first -- because it's easier --
is to just make an Excel spreadsheet that can be used to change all of the
channel parameters in a "tw" file (xmit freq, rcv freq, tone squelch,
power, modulation deviation, and channel label). Since this will be in
Excel, it will be possible to copy, paste, sort, etc. in laying out channel
parameters. With this strategy I won't need to write the code that
communicates with the radio, since the standard programming software will be
used to write the file to the radio.

Next, I will add in the other "global" parameters,
like time-out, what the function button does, etc.

And finally, I might work on the code to directly communicate with the radio. I have had success reading and writing to the radio using VBA, but I would really like to collaborate with someone who is an experienced VBA programmer and who has some experience working with communications programming. Any volunteers?

Topic: 1888 Message: 1975

Thanks John and every one for the reply's I have spent most of the after noon playing with this problem. Ed and Ed are relay going to love this .After comparing FCC commercial Channel Spacing and what the wouxun does .
I found the Flowing .

Narrow narrow channel spacings assigned by the Fcc Goes like this

155.5500 MHz

155.5425 MHz

155.535 MHz

155.5275 MHz

155.5200 MHz

155.5125 MHz

For other channels check part 90 .
It works out to 6.25 kHz bandwidth plus a guard ban between channels equals 7,5 kHz. Steps between the channel centers for the US needs \ a 7.5 kHz step and it has to start in the right place to work.

A better fix would be a 2.5 kHz step.

You need 5 kHz for the ham band so the wouxun is still a good ham rig.

Well Ed and Ed it is time to tell Mr Chan he has made a slight mistake and needs to fix it send him a copy of part 90 and tell him it needs to tune these frequencies to work in the us

Thanks again for all the reply's and

73 All

☐

Hi friends,

I have been experimenting with creating an
alternate programming method for the Wouxun KG-VD1P.

So far I understand the layout of the "tw" file,
and I understand the protocol for communications between the computer and the
radio.

Yesterday, for the first time, I used VBA (Visual
Basic for Applications -- software that comes free with Excel and other MS
Office products) to actually modify data on the radio, and I was able to program
a channel label (including putting a space in the label name). This is a
big deal for me, because the last time I was really doing programming
professionally full time was in the early 80s (and a lot has changed since
then!). Since then I have done project management and analysis work, and
some programming, but it has not been my main work.

What I plan to do first -- because it's easier --
is to just make an Excel spreadsheet that can be used to change all of the
channel parameters in a "tw" file (xmit freq, rcv freq, tone squelch,
power, modulation deviation, and channel label). Since this will be in
Excel, it will be possible to copy, paste, sort, etc. in laying out channel
parameters. With this strategy I won't need to write the code that
communicates with the radio, since the standard programming software will be
used to write the file to the radio.

Next, I will add in the other "global" parameters,
like time-out, what the function button does, etc.

And finally, I might work on the code to directly
communicate with the radio. I have had success reading and writing to the
radio using VBA, but I would really like to collaborate with someone who is an

experienced VBA programmer and who has some experience working with communications programming. Any volunteers?

David

Thanks Dan.
Mr. Chan is in my speed dialer. I'll let him know.
Some of the problem in trying to convince a manufacturer to do an improvement for you is that they consider the WORLD as their marketplace, not just the U.S.

We'll keep giving them feedback though and hope it hits pay dirt at some point. Meanwhile, we love our radios.

Thanks John and every one for the reply's I have spent most of the after noon playing with this problem. Ed and Ed are relay going to love this .After comparing FCC commercial Channel Spacing and what the wouxun does .
I found the Flowing .

Narrow narrow channel spacings assigned by the Fcc Goes like this

155.5500 MHz

155.5425 MHz

155.535 MHz

155.5275 MHz

155.5200 MHz

155.5125 MHz

For other channels check part 90 .
It works out to 6.25 kHz bandwidth plus a guard ban between channels equals 7,5 kHz.
Steps between the channel centers for the US needs \ a 7.5 kHz step and it has to start in the right place to work.

A better fix would be a 2.5 kHz step.

You need 5 kHz for the ham band so the wouxun is still a good ham rig.

Well Ed and Ed it is time to tell Mr Chan he has made a slight mistake and needs to fix it send him a copy of part 90 and tell him it needs to tune these frequencies to work in the

us

Thanks again for all the reply's and

Thanks Walter,

I found that on the Argent site, and also noted the warning there that two of the colours may have been reverse by the factory (!) - and they were on my cable when I checked it out.

Looks like I have it working now, though still struggling a bit to get VHF APRS to do anything interesting.

Follow the wiring colors in the Argent Data Web Site.

This is from their Site:

All of our speaker mic cables should be wired as followed:

Red - Speaker
White - Mic
Blue - PTT (if used)
Black - Ground

I have been using this cable for a few months and I just followed the color code.

My desktop charger has a constant hum. It doesn't matter if the radio/battery is charging. I suspect it is normal, but it is at just the right frequency to bother me.

Is the hum normal?

Is there anything I can do about it?

Thanks,
Brian

Hi,

Hmm. Check the parameters on your printer. When I print on my laser printer landscape, I get all columns intact. There is nothing in the software for the radio that will allow you any changes for printing. I suggest you dig around in your printer software and see if you can change the margins, at the same time reducing the image as discussed previously. What printer are you using?

Hope this helps, good luck

Where can you tune your wouxun to

All the 2mtr ham band in the us

all the 420 to 440 ham frequencies

all 450 to 470 MHz FCC Standard Frequencies in the US 6.25 kHz steps

But the High band commercial Frequencies in the US have problems when you try a narrow

channels like 155.1075 MHz it just will not go there you need a 7.5 kHz step not on the wouxun

Today I looked at all the china made radios on the web and they just don't do it ether except for a few exceptions

So if you looking for a good 2mtr 440 MHz and Commercial UHF Rig the wouxun KG-UVD1P is a very good rig and also works good on over halfe of the high-band channels too

Gentlemen:

I will be at the Shelby, NC Hamfest (held in Dallas, NC) Labor Day weekend, September 4th & 5th. For those that have never been to Shelby, it's one of the oldest and largest hamfests in the Southeast. My location will be in the outside vendor area; look for the Wouxun.US flag. And hopefully the line of people buying Wouxun HT's ;-)

I'll have lots of the new KG-UVD2 models in 440 & 220 version, along with accessories. Please stop and say hello if you attend this event.

1990. Alternate programming software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-23 07:53:08 UTC
From: J.M
Topic: 1988 Message: 1990

Hi all,
I have been testing it for a couple of days now and it seems to work just fine!
Here is a link to the first (to my knowledge) alternate e programming software
publicly available for the KG-UVD1P:

http://www.chmurka.net/p/wouxun.tar.gz

It has been written by two people from Poland, It's free and comes with all
source code, credits to them! This is a linux software, I haven't tested it but
it might work on OSX. It allows import / export frequencies to a CSV file that
can be edited with your favorite spreadsheet editor (OpenOffice, Excell....). So
you can insert rows, cut, paste...

Now it's possible to program your radio natively from Linux!

Hi John,

According to the manual (and also based on my experience), you can only lock out a channel by using programming software (such as the software Wouxun makes available at no charge) and the programming cable.

With the Wouxun software, in the "Channel Message" window select "ON" in the "Scan Add" column to enable scanning of a channel; "OFF" disables scanning of a channel.

Using the Wouxun 1.15 programming software under "Channel Message",
just set the "Scan Add" column for the appropriate channel(s) to
"OFF". Works great here.

I am not aware of a way to do this from the HT keypad directly.

Good Luck.

1996. New KG-UVD1P Owner

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-23 15:32:05 UTC
From: robrobinette2
Topic: 1996 Message: 1996

I just received my KG-UVD1P and it's a J08 serial number. I set the receive and transmit limits to 350-520 using the latest unlock program. I have confirmed with test equipment that it will actually transmit from 420-520MHz.

The receive range is the same, 420-520MHz. I ran the scan function from 350 up with the squelch set very low and it picked up nothing until it hit 420 and immediately stopped scanning when it picked up stray noise. So I can enter a freq below 420 but it does absolutely nothing.

The Serial Number sticker under the battery lists the radio's freq range from 136.000-174.995 & 420.000 - 519.995 and it does receive and transmit in that range.

What a cool little ham/commercial radio. I can see why this group is so active. It's too bad the "vfo" function is such a pain--"Menu" "21" "Menu" select "Freq" or "Name," "Menu."

I got mine in three days from Ed at wouxun.us for $107 + shipping.

So far I'm very impressed.

Repeat of old Dealer Mode Info--
Dealer Mode

Press 8 and then Power On
Password 268160

When you have a channel programmed, the radio will not let you change power, tone, busy lock, wide/narrow etc from the keypad. Dealer mode allows such changes.

Dealer mode Does Not allow changes when the software has programmed Menu OFF.

When you are in the open or computer and programming cable are not at hand, you can change the high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth and parameter on every channel through the dealer operation mode.
Operation Method:
Holding on [8] key and powering on the transceiver at the same time, then inputting password "268160", the transceiver enters dealer operation mode.
When you are changing the above parameters on channels, please firstly call out the channel that will be changed, and set it as the master frequency through [A/B]. Then you can change the parameters of high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth .
SAVE & EXIT: Press [MENU]+ [A/B].

Hi,

What about non-Windows users? Wouldn't it be better to write something in an OS agnostic programming language that we all can use?

I was doing some digging into the protocols myself - what you've written has really helped me! I was expecting each 39 byte line to be a single record containing all of the fields (OO brainwashing), not a list of single attributes. I'm sure I'll be able to knock something Open Source up in Python.

I'd like to be able to pick your brains on occasion if that is OK?

Many thanks once again,

Matt M6FNG

>
> Yesterday, for the first time, I used VBA (Visual Basic for Applications -- software that comes free with Excel and other MS Office products) to actually modify data on the radio, and I was able to program a channel label (including putting a space in the label name). This is a big deal for me, because the last time I was really doing programming professionally full time was in the early 80s (and a lot has changed since then!). Since then I have done project management and analysis work, and some programming, but it has not been my main work.
>
> What I plan to do first -- because it's easier -- is to just make an Excel spreadsheet that can be used to change all of the channel parameters in a "tw" file (xmit freq, rcv freq, tone squelch, power, modulation deviation, and channel label). Since this will be in Excel, it will be possible to copy, paste, sort, etc. in laying out channel parameters. With this strategy I won't need to write the code that communicates with the radio, since the standard programming software will be used to write the file to the radio.
>
> Next, I will add in the other "global" parameters, like time-out, what the function button does, etc.
>
> And finally, I might work on the code to directly communicate with the radio. I have had

success reading and writing to the radio using VBA, but I would really like to collaborate with someone who is an experienced VBA programmer and who has some experience working with communications programming. Any volunteers?

I doubt that will fly with the part 90 acceptance. The radio has to have a provision that the end user CANNOT change any settings. For commercial use, the radio has to be locked so that all the user can do is change channels and talk. There can be no front panel programming. Dealer mode leaves it wide open for the user to go where they cannot legally go. That is why the software can lock all menu functions.

2003. A fix fot the highband split channels

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-23 21:15:43 UTC
From: dan.wb5do
Topic: 2003 Message: 2003

Add a 7.5 khz step to the rig it will make it track split channels from 154.65 to above 160mhz this is a software fix too. 2.5khz would be better but will never happen with out a hardware rework. about all the channels could be fixed with 7.5khz using vco shift also but more hardware to add.

> Keisha's statement is true and is obvious to anyone who attempts to print from this radio's program.What is troubling is that the manufacturer of this radio does not seem to understand the importance of having a complete printed record of the radio's memory especially for people engaged in emergency communications in the United States.Communicating the importance of this issue to the manufacturer is like pushing on the end of a wet noodle! No pun intended!The KG-UVD1P is a great radio, but its ultimate value is diminished (IMHO) because of this printing issue.Correction of this problem plus the addition of a 2.5 KHz PLL Step Size would make this radio a giant killer in the Part 90 world once the VHF High Band narrow-banding is totally in effect.

2009. Re: [Wouxun_KG-UVD1] Linux Software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-24 04:23:36 UTC
From: David Horn
Topic: 2005 Message: 2009

Compiling the linux source code under ubuntu 10.04 just requires a
few dependencies:

1) You need to install Gnu C++ compiler (g++), and gnu make. Open a
terminal, and type:
sudo apt-get install g++ make
2) You need to download the tarball using something like:
wget "http://www.chmurka.net/p/wouxun.tar.gz"
3) Extract the tarball using:
tar -xvzf wouxun.tar.gz
4) Read the README file
cd wouxun;more README
5) Compile the source
cd src;make -f Makefile clean all
6) Ignore the g++ compiler warnings, but pay attention to any errors
(likely none)
7) Connect your radio to the programming cable and pc, and turn it on.
8) Test your new binary:
./wouxun test -p /dev/ttyUSB0

9) Read the README file again for other examples.
Command line syntax is: wouxun <command> [command parameters]

Valid commands and their parameters:

test -p <port>
get -p <port> -f <binfile>
put -p <port> -f <binfile>
export -f <binfile> -c <csvfile>
import -f <binfile> -c <csvfile>

Other hint: If you connect your USB cable to your linux box, but do NOT
know what port is being used as as serial port, try the following:

dmesg | grep ttyUSB

would result in:
[552.421521] usb 5-1: pl2303 converter now attached to ttyUSB0

which means to use the -p /dev/ttyUSB0 as the port parameter.

I can upload the 64-bit ubuntu 10.04 binary to the file library if anyone
wants a pre-built version for that platform.

Good Luck.

Dave - KJ4VZN

2011. Re: [Wouxun_KG-UVD1] Linux Software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-24 05:54:46 UTC
From: David Horn
Topic: 2005 Message: 2011

I also compiled the source code under cygwin to allow people to use
this new software from windows command line.

It is available in the Yahoo Group file library under "Files >
Software > Command Line Util" with a filename of
"wouxun_linux-src_win32-cygwin-binary.zip".

It is a pre-compiled win32 version WITH the cygwin runtime components.
Extract all of the files to a folder, and run "wouxun.exe" from the
command line (cmd.exe).

e.g.:
Open a terminal (Start->Run->cmd.exe)

cd wouxun
wouxun.exe test -p /dev/com7

Please see the original README file (also included in this zip), and
send the author some beer! (not me!)

I have tested on my limited machines (Windows 7 64-bit, and Windows XP
32-bit) with success.
If you are not familiar with the windows command line interface, this
application may not be for you.

Beware, no warranties, may eat your cats and/or USB ports, use at your
own risk ;)

Good Luck.

Dave - KJ4VZN

Hi,
You are probably missing some dependencies, see the post from David. I have compiled and used it on Ubuntu 10.04 and it works just fine.
Also thanks David for posting a version compiled with cygwin for those who want to use it under Windows. Since with this software you can use Excell or Open Office to enter / edit your channel it might be a workaround for people having problem printing with the original software developped by Wouxun.
I haven't tried to enter channel name with spaces yet, but it might fix this issue too.
Anyways I posted the link to the software yesterday as I thought some people would be interested (there seemed to be people interested in the instructions I posted on how to get the Wouxun software running under wine, so I think there is a Wouxun/linux user community out there). Also I thought it might help other people working on alternate software. These guys in Poland have made a pretty interesting reverse engineering job, credits to them!

From: Bob DeVance
Topic: 37 Message: 2013

Fantastic work, SP5GOF & SQ5LWN!!

It works under Windows 7 64 bit! This is no small accomplishment!

A couple of tidbits of advice for Win 7 users and the process for using the CMD window:

1. Always run cmd.exe as administrator to avoid permissions writing to the Wouxun directory.

2. Right click on "Computer" and select "Manage".

3. Click on "Device Manager"

4. Double click on "Ports"

5. Note the port number assigned to the Prolific USB-to-Serial device - i.e., COM1, COM3, COM11, etc. If you DON'T see this, you're not connected to the adapter cable - not plugged in, not recognized, etc.

6. Close the Computer Management window.

7. Create a "Wouxun" directory off the C:\ root-level directory. This is easier that wading through multiple levels to get to it.

8. Un-zip the file downloaded from the Yahoo group to the c:\wouxun directory.

9. Start the command prompt window as administrator.

10. Type in cd \wouxun and then press Enter. The prompt should change to C:\wouxun.

11. Type dir and then press enter. This will display a list of the files in the directory - if no files - then the un-zip did not work correctly or the files went somewhere else.

12. With the cable and radio connected and turned on and set to UVD1 in the bottom line of the display (press the "TDR" key on the radio to get this), type in the command (or cut and paste using the rudimentary editing capabilities of the command window).

NOTE: Windows is NOT case sensitive for directory names and file names as Linux/UNIX are. The Wouxun.exe may be case sensitive to file names, etc. I have not tried it using any upper case letters for the commands.

My command list is as follows:

NOTE: Use your own COM port number from # 5 above in the commands that
follow.

Get data from radio:

wouxun.exe get -p /dev/com3 -f wouxun.bin

Creates wouxun.bin intermediate file.

Export data to Excel csv file:

wouxun.exe export -f wouxun.bin -c wouxun.csv

Edit the file in Excel as needed.

To write it back:

Import the modified Excel csv file:

wouxun.exe import -f wouxun.bin -c wouxun.csv

Write it (back) to radio:

wouxun put -p /dev/com3 -f wouxun.bin

Again, thanks SP5GOF & SQ5LWN for the great work!

Nice to know.

Yaesu charges $60 for the "upgrade" to the VX-8R. About half the price of a new KG-UVD1P.

John,
Just to let you and every one on the list that is a prospective buyers of the Wouxun KG-UVD1-P,D> family of radios, and in general any Wouxun radio.

WOUXUN TO DATE HAS NOT PROVIDED ANY FIELD OR EVEN "DEALER" UPGRADE TO ANY OF THEIR KG-UVD1 FAMILY LINE OF RADIOS THAT ARE OPERATING IN THE FIELD.

THEY ONLY APPLY THE "FIXES" TO NEW PRODUCTION RADIOS ONLY, AND THIS VERY GRUGINGLY.

IF YOUR RADIO HAS A PROBLEM WITH HOW IT OPERATES BE IT FEATURE WIZE OR IN ANY OTHER WAY EXCEPT A ACTUAL DEFECT IT WILL STAY THAT WAY.

So that if you buy a radio that is in the dealers hands now and they "fix" a problem YOU will not HAVE THE FIX only the buyers who receive the latest factory shipment will have it.

How do I know this I have 3 identical looking radios that all have different software loads and I am not able to upgrade any of them, except by buying the "latest" model.

ANY ONE THAT IS CONSIDERING THIS RADIO BE AWARE THAT TO DATE THE EXISTING WOUXUN RADIOS ARE NOR ABEL TO DO THE FCC MANDATED NARROW BAND TEST CHECK FREQUENCIES.
You will be STUCK with a radio that is not field retrofit capable as of this writing.
Rrgards.

I just looked at the Wouxun US webpage.

It says that the power supply for the battery charger is NOT supplied as a standard accessory.

What voltage, amperage, and connector are needed to operate the battery charger?

That may be a mistake. If not I know some of the other US suppliers include a power supply suitable for US use (I just bought a few and they had power supplies).

I really think its a mistake though on the website. You can email Ed and ask.

The charger has a second input for DC in. This is the cable that looks like is being ommited. Out of the box you can charge the battery via 110.

Definitely a mistake. Mine came with the charger and the appropriate power cable. Seems the circuitry to supply correct voltages and etc. is in the charger and not (fortunately, imo) a separate wall wart type thing.

Topic: 2017 Message: 2024

Just bought mine last weekend at Huntsville hamfest came with drop in charger and the cord was for a 110v straight to the wall outlet type (no wallwart).

I just looked on the bottom of my charger

WARNING:

Only use in this model. High voltage, don☐t dismantle for layman (?)

INPUT 100-240VAC 50-60hz (Hmmmm??)

OUTPUT 8.4VDC 450ma

Oh yeah MADE IN CHINA

Of course this is like many things we see from the Asian markets, MANY DIFFERENT PACKAGE TYPES.. some have this and others have that.

SO far I like the radio pretty well, wish it had a few regular items we are accustomed with other rigs but I now can sit in the living room or anywhere on the property and hit the repeater with 1 watt (CROSSBAND REPEAT baby!!) I have a old FT-5200 that I have not used in many years and the display is messed up and it works good enough for this QTH so a good investment for the UVD1P for that alone.

One other side note, just to let you on the list know I bought this radio at Huntsville with good ole AMERICAN dollars, radio is made in CHINA and bought from two good ole boys from ARAB, Alabama !!

The description on the web site says "110vac/12vdc Battery Charger (12v source not included)". Perhaps I should have added "but you do get a 110vac cord so you will be able to charge your battery at home".
jeez......

Here is the reality of what happens---Try to input 155.1075 and get..
5 step 155.105
6.25 step 155.106
10 step 155.100
12.5 step 155.100
25 step 155.100
50 step 155.100
100 step 155.100
What am I doing wrong?

2033. Reality Check For the skip channel problem

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-25 07:32:37 UTC
From: dan.wb5do
Topic: 2033 Message: 2033

First This is not just a wouxun Problem. All China made radios just about it have the same Problem HYT, FDC, Linton, Puxing, and TYT to name a few. Motorola has models with this problem also.

And a lot of these radios can not be fixed by Re doing software it will take hardware changes.

The wouxun will probably have to have a new pll to do 2.5khz steps so it will be unfixable by software any way.

I started with a wouxun KG-699E before they made A KG-UVD1. When it cam out I got one it was a very good rig. After the KG-UVD1P cam out I got one and still have it. It is a great radio and it is my favorite 2Mtr 440Mhz rig.

I have never seen or herd wouxun say or print that there radios were software upgradable.

It tunes the 2mtr band no problem and tunes 440Mhz Ham band no problem. It tunes commercials channels in the 450Mhz to 470Mhz band no problem.

If wouxun wishes to continue to sell radios in the us commercial market they will have to fix this vhf problem. Some of the china mfg. have already added the 2.5khz pll step to there radios. I'M sure Mr Chan at wouxun will flow suit.

I'm rather confused at the discussion here. What are the "splinter" frequencies that are being talked about? Here in UK, our 'ham' channel spacing is 12.5kHz on 2m, and channels are all multiples of 12.5kHz.

I have the impression that this group is largely hams (okay, I know we have a few who aren't) and for Europe there is no problem programming all of the frequencies that we (hams) need for 2m FM. What is happening in the (near?) future with the FCC in USA, and does it affect amateurs?

Can somebody explain all this furore???

Mine came direct from China (before we got distributors in UK). It has a hard-wired mains plug (100 to 240 volts - with 50/60Hz to accommodate us Europeans and MOST of the rest of the world who don't have 60Hz!) and also a socket on the charger for a car lead (both the mains lead and car cigar-plug sockets on the back).

I've just invalidated the warranty on my cigar-plug lead (!) and there's nothing inside the plug except fuse, and a resistor driving the indicator LED - the 12-13.5v from the car is fed straight to the plug on the charger.

Subject: RE: [Wouxun_KG-UVD1] Re: Wouxun Battery Charger power supply

Just bought mine last weekend at Huntsville hamfest. came with drop in charger and the cord was for a 110v straight to the wall outlet type (no wallwart).

I just looked on the bottom of my charger

WARNING:

Only use in this model. High voltage, don't dismantle for layman (?)

INPUT 100-240VAC 50-60hz (Hmmmm??)

OUTPUT 8.4VDC 450ma

Oh yeah MADE IN CHINA

Of course this is like many things we see from the Asian markets, MANY DIFFERENT PACKAGE TYPES.. some have this and others have that.

SO far I like the radio pretty well, wish it had a few regular items we are accustomed with other rigs but I now can sit in the living room or anywhere on the property and hit the repeater with 1 watt (CROSSBAND REPEAT baby!!) I have a old FT-5200 that I have not used in many years and the display is messed up and it works good enough for this QTH so a good investment for the UVD1P for that alone.

One other side note, just to let you on the list know I bought this radio at Huntsville with good ole AMERICAN dollars, radio is made in CHINA and bought from two good ole boys from ARAB, Alabama !!

John

My KG-UVD1P came in a factory box with a charging stand, a 110V wall wart, and a 12V cigarette lighter plug. I am sure they come with a charger unless someone is trying to get 'cute' with pricing.

Can I suggest using it with the RX set to 155.106 - that's not too far away from .1075 so I suspect it will work pretty well.

(what sort of frequencies do you guys use in USA??!!)

I'm rather confused at the discussion here.
What are the "splinter" frequencies that are being talked about? Here in
UK, our 'ham' channel spacing is 12.5kHz on 2m, and channels are all multiples
of 12.5kHz.

I have the impression that this group is largely
hams (okay, I know we have a few who aren't) and for Europe there is no problem
programming all of the frequencies that we (hams) need for 2m FM.
What is happening in the (near?) future with the FCC in USA, and does it affect
amateurs?

Can somebody explain all this
furore???

Stu, G3OCR

Thanks for the explanation Dan. So what it comes down to is that the FCC are going for 7.5kHz channel spacing for "high band" (?)

Guess that could be good for hams in US, as there will be a lot of commercial rigs coming onto the market there! I remember back to when UK went from 50kHz spacing to 25k, and again when the UK authorities moved the commercials to 12.5kHz - each time there was a big bonus for hams who were prepared to modify the rigs for 2 metres (in those days it was physically re-tuning the oscillators and multipliers etc!)

I guess in the medium term the UVD1P won't be a good buy for US commercial users, except for a temporary solution, but nothing wrong with it for ham use :)

Stu

What the hoopla is about tuning all US high band channels see below you need a 2.5 khz PLL steps to do this

the destop charger is one of the standard accessories which comes with the transceiver set, and the Li-ion Battery charger:

APPLY PILE:1A31KG-2
INPUT:100-240VAC 50-60Hz
OUTPUT:8.4VDC 450mAh

and of course the destop charger is with the power cord as the standard accessory. :)

It has a hard-wired mains plug (100 to 240 volts - with 50/60Hz to accommodate us Europeans and MOST of the rest of the world who don't have 60Hz!) and also a socket on the charger for a car lead (both the mains lead and car cigar-plug sockets on the back).
>
> I've just invalidated the warranty on my cigar-plug lead (!) and there's nothing inside the plug except fuse, and a resistor driving the indicator LED - the 12-13.5v from the car is fed straight to the plug on the charger.

Hello Dan,

Sorry for the confusion.

In UK the channel step is 12.5KHz.
FCC Part 90, the channel step should be 2.5KHz?
The channel steps selectable for KG-UVD1P are 5.00KHz, 10.00KHz,12.50KHz,
25.00KHz,50.00KHz and 100KHz.
???

Keisha

2051. Fw: KG-UVD1P internal memory and firmware updates

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-26 10:21:25 UTC
From: David A. Behar
Topic: 2051 Message: 2051

Whoops!

I now understand that the CPU has one-time programmable (OTP) ROM -- it looks like 16k x 13 bits -- and this is the likely place for the control program. I.e., it makes sense that this is the physical place where the firmware resides, in which case it would not be possible to upgrade firmware.

But the 8 kByte EEPROM is where the channel info (xmit freq, rcv freq, CTCSS, power, narrow/wide, label, and more) is stored, and the FM Broadcast memories are also stored on the EEPROM. It is the EEPROM which is accessed with the programming software.

David

Subject: KG-UVD1P internal memory and firmware updates

Hi friends,

I have analyzed the structure of the "tw" programming file, and I have also analyzed the communications protocol between a computer and the radio. I have also read the KG-UVD1P service manual. Based on that analysis, I believe (but can't be 100% certain) that it would be possible to perform a firmware update, even though I understand the company denies this. I will explain how I reached this conclusion.

First, the communications protocol between a computer and the radio -- whether downloading programming to the radio or uploading programming from the radio -- consists almost totally of "Read" and "Write" commands. Each command includes a single letter (byte) -- "R" for Read and "W" for Write; and then a two-byte address; and then a length of the data block. For example, the data communications is usually 64 bytes at a time.

When you download data to the radio, all you are downloading is 128 16-byte channel records for channels 1 to 128; 128 16-byte label records for channels 1 to 128; 2 16-byte channel records for VFO A and VFO B; and another 64 bytes of information for general radio settings.

By the way, the program which reads and writes band limits for transmitting and receiving uses the identical protocol, and there is just a specific address in the radio memory where this information is stored.

According the the service manual (mine is marked Model KG-UVD1P, Version KG-UVD1-0905-V1), on page 13, under the heading "VII Memorizer Circuit", we see the following text:
The memorizer circuit is made up of CCPU (IC811) and EEPROM (U811).

The capacitance is 64k bits, including the handset controlling program by CPU and the operation function data.

Under this text appears a simple diagram showing a single CPU communicating with a single EEPROM.

Note that the "64k bits" is 8k bytes. The radio programming information takes up a bit over 4k bytes (a 16-byte channel record and a 16-byte label record for 128 channels, plus just a bit more memory for other radio configuration information), leaving a bit less than 4k bytes for the radio control program. Note that the manual indicates that both the radio data and also the control program are stored in this single EEPROM.

Since the radio-computer serial communications protocol seems to permit reading and writing to any address in the EEPROM, if a person were to know where to apply a patch it should be possible to update the firmware. In fact, a person could read the firmware from two versions of the radio and see exactly what the differences are. However, since the CPU is presumably accessing the EEPROM on a continuous basis -- including to run the serial data communications protocol -- in practice there would be a danger of modifying a portion of the data control program which is being used during the data transfer protocol. Therefore, experimenting with this would have a risk of corrupting the radio control program, rendering the radio unusable.

But if the radio control program in the EEPROM is written in a way that the communication code were segregated in one part of memory, then it should be possible for Wouxun to provide an updating program which would update firmware (but not mess with the data communications code).

David

i have to say i could really care less if this little rig won't cover all of the latest band changes. my vx-7r won't conform to that either but i have no plans to toss it out.

the fact is this radio and all the others will still support 99.99999% of the repeaters and still allow enough flexibilty to go simplex with anyone.

for 1/3rd the price for a dual band rig i knew it had limitations going into the purchase. sorry, won't be any fire sale here.

not every ham in the us is a tech geek, some of us actually use these for comms other than just ham radio fun.

mike

Don't worry about it Stu. AFAIK the USA is the only country going for these 'splinter' frequencies. The whole thing may even be down to some form of 'Not Made Here' protectionism for American radio manufacturers (If there are any left?).

You know the sort of thing. Like we used to have 20-25 years ago in Europe, when France allegedly routed all imported TVs and VCRs through some tiny backwater French town's Custom's office, to slow their import down to a snail's pace.

The fact is that the USA market is not that large anymore so unless other countries go for the 'splinter' frequency option, China may just ignore it. In Europe we've gone for digitalisation of business/public-service radio, rather than just creating more channels, as you know.

As you say, the Wouxuns are great little 'ham' radios. So they don't do USA business/public-service..... Never mind.

Gareth.

It is still good for UHF and does us ham OK the vhf commercial is the big thing and it will do half of them but the fcc is starting to assign the splinter" frequencies and it is getting to be a problem.
One China Mfg Told me they are coming out with there new model that should tune the whole world. Supposed to be out by November

Your right Stu it is a great ham rig and a great commercial rig if you don't get one of those splinter" frequencies

You can program different memories set to different power levels.

Also.. with the UVD1P you can hit the TDR button while transmitting to change
power levewls.. try it with the UVD! (non P) and see.

Some radios, such as those imported from china will allow transmit on non-ham frequencies.

To solve this, simply get the "unlock software" and then lock out the non-ham frequency range. I've actually done this. My 2m/70 cm radio only transmits on ham freqs, but allows me to receive out of band (weather freqs and such)

My 2m/220 radio is the USa version (bought from our friend Ed) and needed no adjustments.

2063. Newbie question on programming software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-26 21:05:14 UTC
From: Les Keegan
Topic: 2063 Message: 2063

Well I decided to get one of these. It arrived and with some reading I was able to program a few repeater frequencies in it. I downloaded the programming software from Wouxun and set up several files while awaiting the programming cable. I received the programming cable and set it up to the radio and computer. As I do with any of these programs, I first tried to read from the radio to the program before sending anything to it. I kept getting a "Failed Communication" message. The help menu suggested checking the cables which I did and all checked fine. Good connections on both ends. Still not able to receive or send to the radio. I have Vista Home Premium. I set the comm port to 9. I had the choice of 3 & 9. When 9 didn't work I tried 3 still I can't get it to work. Anyone have any suggestions?

Assuming that the prolific usb device is showing as a comport and correct driver is installed have you tried pushing the cable into the radio a little bit more as the connector can sometimes sit just short of all the way home and looks connected but results in this error.

Make sure you have the Visata/Win7 driver... It CAN be quirky... Windows likes to assign com ports I'm up about 12.. I have to kill them. Every time you plug it, it reinstalls drivers, then assigns a com port. Even though you have used it before... Your device manger may be an area to investigate... Vista and Win7 can be fun

It can be a hassle; but with patience, it works well.

It took me a bit to figure it out.,,.,, still not perfect.... but i can get it going..... with a lot of words under my breath... but MAKE SURE you have the right drivers! The disc you got does not have everything you need.

Les,

Sometimes, in fact, quite often, when I am downloading a program to a radio I get a failed message. I simply <SEND> again and it goes through the second time no problem. It might be a quirk in the programming software but when I see it now I simply ignore it and hit the <SEND> button a second time for SUCCESS.

Good luck.

The Unlock program allows one to narrow the allowed frequencies on both Tx and Rx to any desired spectrum within the capabilities of the radio. My radio is a 136-174 and 420-520 unit. I can narrow the working frequencies to any range within the above limits.

Try turning radio on and off and try to read it multiple times. Sometimes mine takes 3 or 4 tries to get connected. Be sure that whatever cable you are using shows up as a Com port and use that number. Be sure the connector cover is rotated 90 degrees and is not interfering with the plug in connector.

Ok to all that replied. Thanks very much for your ideas. I have tried reinstalling the driver, I set the comm ports, I have tried repeatedly to get it to read the radio. I have checked all the connections of the cable and still I can't get it to work. I believe the cable I have is bad. Also I need to clarify that the message I am getting is Failed Connection and not what I originally said. My bad. I will contact the vendor and try to get another cable to see if it will work. Again thanks for everyones help.

It's a "false" positive. You are fine.

Ed:
I did as you suggested and downloaded the Find Comm Port software. I ran it and got the following:

Comm3 This port appears to be a modem

Comm9 This port appears to be a cable without EchoLoopback.

I use Comm port 9 to program several models of Icom Radios and also a Kenwood F6A with no problems.

Les

Your problem is most likely with the USB driver. Go to Device Manager and look under ports. If you don't see a Prolific serial port listed you have a driver problem.

I had to run the .exe program included with the usb driver from Wouxun to get the USB driver to work. Before I ran the .exe program the driver wouldn't install properly (Device Manager showed a "driver problem").

First thing to check is that you have the cable FULLY home at the radio end - it's very easy to think it is plugged right in when it's not!

I have made this mistake, as have a number of other members of this board!

Subject: [Wouxun_KG-UVD1] Newbie question on programming software

Well I decided to get one of these. It arrived and with some reading I was able to program a few repeater frequencies in it. I downloaded the programming software from Wouxun and set up several files while awaiting the programming cable. I received the programming cable and set it up to the radio and computer. As I do with any of these programs, I first tried to read from the radio to the program before sending anything to it. I kept getting a "Failed Communication" message. The help menu suggested checking the cables which I did and all checked fine. Good connections on both ends. Still not able to receive or send to the radio. I have Vista Home Premium. I set the comm port to 9. I had the choice of 3 & 9. When 9 didn't work I tried 3 still I can't get it to work. Anyone have any suggestions?

From: a911pro
Topic: 2085 Message: 2085

Hi, I have a question on programming via software.

On the Optional Function page there are two fields under Frequency Mode A (&B)labeled "Current". They seem to have frequencies entered by default but what are these fields used for? There is no help on this in the software that explains this. Thanks, Don

Topic: 2085 Message: 2086

These need to be set for the highest frequency you plan to program into memory. If not you will get the "Out of Range" warning. So if your radio is a version for 136-174 & 350-470, set A to 174 and B to 470. You can then set a receive memory anywhere within your radio's range.

Ok, thanks. I assumed something like that. I may have received the wrong radio per the specified ranges 144-147 and 420-449 MHz on the label. I assumed I would receive a unit for commercial use not a Ham rig. It does seem to accept programming in the 450-470 MHz range though but most likely at reduced performance.

What you have is a radio that was factory-set to transmit in the ham bands only. It will still receive within its full range, probably 136-174 & 350-470. You can use the unlock software to "read" what the limits are for both TX and RX. If you are licensed to transmit outside the ham bands, you can use the unlock software to change the transmit range. You will still need to pay attention to the A and B setting discussed earlier.

Also keep in mind that, although you can set the upper limit as high as 520, you will have poor performance there unless your radio is a 420-520 version. It may transmit outside the designed range but the receive sensitivity sharply decreases outside that range. The reason for this is that there are a lot more tuned circuits, by design, in a receiver. Having it roll off above and below the designed frequency range is a good thing. It reduces IMD from other services and it's a sign of a good receiver design.

Be sure the radio shows UVD1 in the bottom line of the display. Press the "TDR" button on the top right of the radio to get this display. The radio won't respond to data transfer if two frequencies are showing in the display.

These frequencies seem to default to the bottom of the VHF and UHF range of the radio. I have not found a use for these settings.

Hi Ed,
Mine appears different. My radio is a 136-174 and 420-520. The Frequencies in Optional Function are 136.000 and 420.025 (Botton of range) yet I have the radio programmed for many channels above these frequencies. I have not found any use for the Optional Function frequency settings. I am using the Ver 15 software. Any suggestions or comments appreciated.

I downloaded the programming software from Wouxun and set up several files while awaiting the programming cable. I received the programming cable and set it up to the radio and computer. As I do with any of these programs, I first tried to read from the radio to the program before sending anything to it. I kept getting a "Failed Communication" message. The help menu suggested checking the cables which I did and all checked fine. Good connections on both ends. Still not able to receive or send to the radio. I have Vista Home Premium. I set the comm port to 9. I had the choice of 3 & 9. When 9 didn't work I tried 3 still I can't get it to work. Anyone have any suggestions?

This sets the default vfo frequency. it is where you end up when you go to the frequency mode. You can set it where you want it to be at.

These frequencies seem to default to the bottom of the VHF and UHF range of the radio. I have not found a use for these settings.

I think you will find that in the programming software this refers to what frequency is shown in vfo a and vfo b after sending the programming to radio.

Interesting John. Maybe I've been looking at it wrong, perhaps A & B need to be set to one or the other (upper or lower) limit. I've had several occasions where I got the 'Out of Range' warning and found A & B to be set to "something", it could have been in the middle. I just always reset to the high end and it works. I'll play with this some when I have time and see what I find. Or, I'll just ask my Chinese engineer..... God, I bet they get tired of all my questions ;-)

There certainly is some magic in radio programming. My Optional Frequencies will NOT accept keyboard changes?? Not a problem because other programming works OK, but it is confusing.

Ok I did as Keshia suggested and I read what was said on the china two way radio.net site, including rebooting with the cable plugged in. Now I get it to start but it fails halfway through. So I am getting closer. Any suggestions. I have checked and rechecked the the cable connections and still have the above issue.

I assumed those freqs were simply what's in the "two" VFOs--what shows up when you switch from memory to VFO mode. They don't affect my radio's transmission limits.

Hello Rob

Yep you got it right you need the unlock software to move the limints

I assumed those freqs were simply what's in the "two" VFOs--what shows up when you switch from memory to VFO mode. They don't affect my radio's transmission limits.

Be sure the radio shows UVD1 in the bottom line of the display. Press the "TDR" button on the top right of the radio to get this display. The radio won't respond to data transfer if two frequencies are showing in the display.

Bob,
This step has not been necessary with my radio. I just turn it on and there is always two freqs showing. When the programing is finished it does change whatever channels I had showing to memory channel 1 on both A and B.Jim

2107. Receive lights flashes

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-27 15:20:28 UTC
From: skompier
Topic: 2107 Message: 2107

I just received my radio and everything is working fine. If TDR is set to one display, the green light flashes once. If set for dual display, it flashes twice. I would assume this is normal?

With single display, once every 5 seconds. With dual frequency displayed, twice every 5 seconds. Not sure if I was the only one. I'll play around with it and see what I can find out. Thanks.

2112. Poor transmit audio

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-27 20:29:36 UTC
From: grantnz2000
Topic: 2112 Message: 2112

I have poor quality audio on my transmit as do other users in this area.
The audio appears to lack high frequencies making it sound very muffled and so difficult to hear compared to other radios. It's almost as if they forgot to put pre-emphasis on the trasnmit audio.
Actual deviation is OK peaking to 5KHz on the wide setting.
I believe there is a mod for this but can't find any refernce to it.
If this could be fixed, the radio would be excellent but the way it is means I don't use it much.
Other radios I have tried such as the Quasnsheng TG-UV have very good transmit audio but they don't have DTMF which I need.
Grant, ZL2BK.

2113. Single display at startup

Hi friends,

I wish the radio would do this -- start up NOT in "TDR" mode, but there is no way to do this from the radio or from the Wouxun software.

I suppose there is a small chance that there is a way to do this by editing the "tw" file (which I have been experimenting with); if I find a way I will let everyone know.

I've heard this radio's mike needs to be pretty close to your mouth. Have you tried holding it close during your transmit tests?

I do hold it close and the deviation is OK. It's a frequency response
problem rather than a modulation level problem.

I feel a bit dumb but I must fess up. I could not get these frequencies to enter correctly on the Optional screen. Finally figured out that the Step (bottom of screen) setting affects the frequency data input-Duh. Also, these frequencies do indeed become the VFO Defaults when you switch from channel to VFO via Menu 2 1 Freq.

Because you need to change the step size to 5 KHz, not 10. Or else 25 KHz.

You need a Step of 2.5 for that freq. To verify, divide 987.5 by the Step- if you get a whole number (no decimal) it will work. 987.5/2.5=395, so a 2.5 Step would work but not available in the KG-UVD1P. I suspect we are out of luck for getting some of the Narrow Band frequencies with the Wouxuns.

Actually you have to change the step to either 6.25 or 12.5 Either one will work
(987.5/12.5 = 79 987.5/6.25 = 158)
(a 2.5 step would also work, but as stated previously, the unit does not have that step).

Thanks for the suggestions!
The problem is not so much that the second frequency is displayed but that the radio samples both and so may suddenly receive on the second frequency when I want it to only receive on one frequency. If it could be stopped from sampling both frequencies then that would be ideal.

Now that I've used this radio for a couple of weeks I just wanted to say how impressed I am with it. I'm seriously considering picking up another one. I really like it's look and feel--the heft with the AA battery pack is very satisfying. The FCC certified narrow FM commercial coverage is a bonus. The audio is very strong too. I am very pleasantly surprised with this rig.

I also own (and am comparing the Wouxun to) Yeasu FT-41, FT-51, FT-470 HTs and an Icom T-81 tri-band HT. The Wouxun stands up to them quite well.

Always use the full frequency for the calculation, not just the decimal part.
There are some step sizes (e.g., 15KHz, 30KHz) that can give misleading results
with just the decimal part of the frequency.

I've now tried the mod from the uploaded pdf file. It has helped a bit but the transmit audio still needs a lot of improvement.
I tried a speaker/mic as well and the transmit audio is also lacking in high frequencies.
My pcb with the mic on it is different to that in the file. The capacitor shown by the speaker connections is not there. I suspect it's on the other side of the board but I haven't looked there yet.
Will investigate further and also try to measure the transmit audio response at the external mic connection. It will be interesting to compare with some different radios I have here.
The serial number of my radio is I10-6214 with VHF coverage of 136 to 174.995MHz and UHF of 400 to 479.995MHz.

Hi Keisha,

Set your Step size to 12.5kHz and just enter 439.987 (the last 5 will show automatically)
439.9875 is just another standard 12.5kHz channel.

We had the 25kHz channel step in Europe, before changing to 12.5kHz.
Those countries which had 30kHz and 15kHz seem to find the mathematics much harder.

Gareth.

Hi Rob,

Yes, most of us who have bought them just love the rig!

There may be a few things that some of us would like to see different, but no piece of equipment is going to be "all things to all men" (especially not at that price!!).

My XYL is taking her UK Foundation license later this year and guess what she'll be having as her "personal" rig?? ;)

The only problem (and it's not a Wouxon problem) that I have is that I bought one of the very cheap speaker-mikes from eBay, the yellow one, and I've heard play-back of the audio which is awful. I've found it can be improved a lot by opening up the aperture in front of the mike insert. Repeat, this is not the Wouxon rig mike - that usually gets excellent reports!

Subject: [Wouxun_KG-UVD1] This is a great little radio

Now that I've used this radio for a couple of weeks I just wanted to say how impressed I am with it. I'm seriously considering picking up another one. I really like it's look and feel--the heft with the AA battery pack is very satisfying. The FCC certified narrow FM commercial coverage is a bonus. The audio is very strong too. I am very pleasantly surprised with this rig.

I also own (and am comparing the Wouxun to) Yeasu FT-41, FT-51, FT-470 HTs and an Icom T-81 tri-band HT. The Wouxun stands up to them quite well.

Tks for all!

Another question:

In channel message, I input the Rx frequency 157.1254 and enter, it automatically changes to 157.1250. And when I input 157.3825, it changes to 157.38125.

???

Dave£¬

Is the USB Driver(for win 7) working well in Windows 7(64 bits) operating systems?

Since mine is windows 7(32 bits) and my friends are alos the same system. I cannot tell whether it is still compatible with the windows 7(64bits).

Tks!

We have put over 40 of them in service with our fire brigade and so far only one had failed on us. These radio seem to be able to take the knocks better that the Motorola units that were costing us 4 times the price. Not one has been destroyed in service in the last 12 months compared to the 4-5 of the Motorola units that were killed per year.

The Puxing 888's we have tested have also survived as well but are not as popular as the Wouxun units we the guys.

Hi Rob,

Yes, most of us who have bought them just love the rig!

There may be a few things that some of us would like to see different, but no piece of equipment is going to be "all things to all men" (especially not at that price!!).

My XYL is taking her UK Foundation license later this year and guess what she'll be having as her "personal" rig?? ;)

The only problem (and it's not a Wouxon problem) that I have is that I bought one of the very cheap speaker-mikes from eBay, the yellow one, and I've heard play-back of the audio which is awful. I've found it can be improved a lot by opening up the aperture in front of the mike insert. Repeat, this is not the Wouxon rig mike - that usually gets excellent reports!

Once again - these are not steps covered by the PLL and the available channel steps. Frequencies have to be divisible by the step sizes available! (and the size actually selected)

I am trying to remember where I located the driver when I first plugged in the cable on Win7 x64. I do know that this is a standard pl2303 usb-serial device, so it works with the prolific usb-serial driver, including automatic support under linux kernel, and some other OS's as well.

Sorry, I can not remember which driver I downloaded (or if windows update found it automatically). I would try first the Wouxun web site here:

http://www.wouxun.com/down_01.asp?SortID=10&SortPath=0,10,

Then try the prolific web site here:

http://www.prolific.com.tw/eng/downloads.asp?ID=31

If you still can not get it to work, I can remove the driver, and reconfigure so that I can tell you for certain which one I am using on Win7 x64. At least the prolific web site driver specifically states Win7 x64 compatibility.

Good Luck.

With the 2m/220 radios I've had, both antennas will work 136-174. One will work 216-239 and the other 240-280. Originally they were different lengths, the shorter one being the higher range. Now I believe they are the same length, so both should have a sticker with the frequency range marked. This is often an red ring around the threaded stud.

I don't have KG-UVD1/UVD1P/UVD2P yet, but was thinking of doing something like this using VS.NET&SQLite...
Haven't figured out the .tw myself and wasn't pursuing it too vigorously as of yet, but I could see myself possibly volunteering a Win XP (free, but not open source) stand-alone application esp. with some cooperation...

I have been using 1.15 with no issues.

When I extracted 1.16, NORTON destroyed it as dangerous.

Guess I'll wait and see.

Thinking of getting one of these radios.

Am I correct in assuming that there is a 144/220 and a 144/420 Version but not a model that does the 3 bands ?

Many thanks

Rob..

From: The Simpsons
Topic: 2112 Message: 2166

I've just tried measuring the transmit audio response of various radios I have here. Should have done this before I modified the Wouxun but unfortunately I didn't.
I used my HP8920 test set to measure the deviation and an HP 3552A as the audio generator. The first set of measurements were done through the external MIC connector and the level was set at 1KHZ to give 1KHz deviation on the 8920.
The second set of measurements was done by connecting a small over the ear headphone to the 3552A. The headphone was clamped over the radio microphone hole and adjusted for best coupling.
The two Yaesu radios were only measured by coupling the headphone over the mic as I didn't have a suitable lead for direct connection.
The results confirm the on air reports of audio quality with the Yaesu VX6 being by far the worst sounding handheld I have used! The VX5 and Kenwood TH215 always get good reports with the TH215 slightly lacking in low frequencies. Not bad for a radio that is now more than 25 years old and still working very well. Its microphone is a bit sensitive and this would account for the higher readings referenced to 1KHz as the low frequency roll off probably gives the higher deviation readings at the higher frequencies.
I hope the formatting of the results does not make it too difficult to decipher!

Here's the results:

Handheld frequency response test

All tests referenced to 1KHz tone at 1KHz deviation, 147.575MHz at lowest radio power setting.

These measurements were direct in to the external mic connector:

Frequency 1.5KHz 2KHz 2.5KHz 3KHz Level at 1KHz

Radio
Kenwood TH215 1.42 1.87 2.3 2.48 -52.4

Quansheng TGUV 1.4 1.7 1.88 1.93 -48.8

Wouxun UVD1P 1.46 1.82 2.04 2.15 -50.7

Feidaxin FD150 1.4 1.67 1.84 1.97 -59.7

These measurements were made by close coupling a small headphone over the radio microphone:

Kenwood TH215 2.0 2.7 3.6 4.5 3.3

Quansheng TGUV 1.29 1.85 2.13 2.98 -6.3

Wouxun UVD1P 1.32 1.6 1.79 2.1 8.6

Feidaxin 150 1.83 2.67 2.7 2.9 3.8

Yaesu VX5 1.3 1.8 2.5 2.8 -2.8

Yaesu VX6 1.2 1.25 1.35 1.48 -1.2

2170. DTMF tones - "Useless"?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-29 23:58:03 UTC
From: zl2ke_steve
Topic: 2170 Message: 2170

I found this review on eham and I wonder if there is any truth in what is stated about DTMF tones being too short for repeaters to recognize?

["And finally, the reall killer - DTMF tones are USELESS. absolutely no good - the local repeater (or any other) can't recognise them because Wouxun made them so short. There is a new version available - but Wouxun offer nothing for those who bought their product the first time (twice)."]

I have not used DTMF tones on my UVD1P yet. I am ready to post a 5/5 eham review but first want to know if the above review is true.

Thanks, Steve ZL2KE

My KG-UV2D works perfect with the repeaters here no DTMF problems with this rig.
Maybe that was one of the improvements they made in this model.

Steve, thanks for the post. The review you reference is partially correct. With the various iterations of this radio over the last couple years there have been model changes and improvements. Originally the KG-UVD model did not offer DTMF tones. Then along came the KG-UVD1 model which offered DTMF tones......this model received mixed reviews by some users who claimed the tones were such short bursts that they were ineffective with their repeaters or echolink (others claimed they had no problems). Fast forward to the more current model (KG-UVD1p)which has DTMF tones for as long as you hold down the key.....I further assume this feature is also a part of the most recent model (KG-UVD2). This help?

Steve you should make your review dependent on your observations, not those of someone who may revel in the ability to rant and rave about something. I've sold 500 radios since May and only one 220 unit had DTMF problems and that turned out to be a keypad issue. If you like your radio like most of those here, tell it.

Tried that twice and no luck so I held the ptt down and started moving the wire and it keyed and unkeyed.
So I believed I traced it to a possible bad wire in the mic cord.

Actually, at the time of writing - it was completely correct.

I wrote it.

First, came the KG-UVD1, which I bought. No DTMF tones at all. Put back in the box after 2 hours, sold at the next rally.

Second, came the KG-UVD1P. I got one of the very first models. The DTMF tones played for about 200ms. Useless. My YL still has this rig now - it's about 6 feet to my right as I type this.

Then, they released an updated model (still called a UVD1P), where the tones play as long as you hold the key down.

Try it, see if it works. That'll answer your question.

However, even though this one here is the second I bought, I'm still expected to buy ANOTHER rig to fix the defect!

Which I won't be doing.

> Steve you should make your review dependent on your observations,

Ed, I am going write my review based mainly on my own observations, but I also wanted to correct the DTMF statement if it was erroneous. I think it is important to include other 'user comments' - if possible - rather than only one's own observations.

I have learned to read *all* eham comments about a product, since many of the negative reviews are due to faulty logic, or incorrect assumptions, or personal preference, uncommon or rare product faults, or ignorance. Often a review will correct an earlier statement on eham. On the other hand, even if an average rating on eham is 5.0 I still would read all reviews since there probably will be some criticism of the product.

Thanks to everyone else who quickly replied, especially Gordon, who wrote the "Useless" eham review.

Cheers, Steve ZL2KE

The DTMF tone for the curent version transceiver can be transmitted as long as you keep pressing the keys. I think this feature is useful.

Yes, we know that - but at the time of the review, the model being sold didn't do that. Unless the repeater or node was recieving you 5 by 9, it had no chance to decode the tones being sent.

The bit that really gets me is that Wouxun ignored all the previous purchasers or their UVD1 models, and expect them to buy another rig just to have the feature they bought it for work.

I failed to apply my first rule of PCs and mobile phones to radio - "let someone else pay to do their product testing for them" :P

2185. Re: Newbie question on programming software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-30 12:56:04 UTC
From: Les Keegan
Topic: 2063 Message: 2185

A follow up to my dilemma. First let me say thanks to all of you for your suggestions. I was talking to friend of mine over the weekend and he said well just borrow my cable and see if it works. Well low and behold it did. So that tells me the driver is fine and the connections were good. Which means I have a bad cable. As I mentioned I was able to start the upload until it failed halfway through. Eventually that diminished to failing at 3 bars. The only thing I did was attach his cable and it did what it was suppose to do.

So I contacted the vendor and a new cable is coming. I tried my cable after I used my friends cable and it continued to fail. Again thanks to all that posted suggestions. I have saved them for future reference in the event I or someone else has a problem.

Les

once you think you have it seated.. press it a little harder. i had the same issue. the plug feels like it has a "stop" about 3/4 of the way in.

i bet that fixes your problem

Topic: 2170 Message: 2188

But didn't someone else post here that the firmware eeprom was a one shot chip? That would prevent any possibility of updates. I read that as Wouxun not being able to not necessarily not willing to. For around $100 in a dual band radio one has to expect shortcomings. It's a price to pay for being an early adopter.

Subject: Re: [Wouxun_KG-UVD1] Re: DTMF tones - "Useless"?

Yes, we know that - but at the time of the review, the model being sold didn't do that. Unless the repeater or node was recieving you 5 by 9, it had no chance to decode the tones being sent.

The bit that really gets me is that Wouxun ignored all the previous purchasers or their UVD1 models, and expect them to buy another rig just to have the feature they bought it for work.

I failed to apply my first rule of PCs and mobile phones to radio - "let someone else pay to do their product testing for them" :P

On 30/08/2010 09:09, Keisha wrote:

The DTMF tone for the curent version transceiver can be transmitted as long as you keep pressing the keys. I think this feature is useful.

Well tried it again and still no go seated the plug as far as it would go
no luck.
Held PTT in moved cord and it unkey then key,so I believe it to be a
broken wire.

I use a number of speaker/mics on my part time job and the standard failure is a bad connection in the radio end connector.

That's where I believe I found the break just above the end connector where
the cable comes into the plug.

Hi all,

Not only am I a newbie with this HT, I'm a newbie ham. Our local club bought 10 or 12 of these little beauties from Ed at:

http://www.wouxun.us/

and the user interface and the Wouxon owner's manual was driving me nuts. While my Elmer downloaded all the local repeater freqs. for me, the radio itself was a mystery.

I ran across the "Eyes Free Manual" on Ed's site and it's great...the only thing you have to remember is that when the manual says "Funtion Key", it's the red "Menu" key on your radio.

If you're trying to figure out what's what with this HT and you're new to the hobby (or the radio for that matter), check out this manual. Also, Ed's good people to do business with...

73,

Owen

I am not a real programmer, but I did open the Programming Software with a Hex editor to see if the ASCII string Welcome or WELCOME existed in the file- It does not. I suspect that the screen data resides in the fixed program part of the radio ROM and is not changeable.

2204. PL110.9 on VHF Receive

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-31 01:49:18 UTC
From: David Wagner
Topic: 2204 Message: 2204

I have two KG-UVD1P's that do not receive when programmed for PL 110.9 on a VHF Freq but do work on a UHF Freq. Does anyone use the PL110.9 on VHF? Trying to figure out if its a problem on a batch of radios or just the two I have. They were both purchased the past month or so.

Just to clarify I have both encode and decode programmed for the 110.9 and I can key the repeater and see the repeater on the S meter but I can not hear it unless I press the monitor or disable the PL. I checked everything 10 times over and its not an operator error that I can tell.

On my mobile radio the 110.9 receives the same repeater just fine (its also just a few miles away so the signal is plenty strong).

Thanks

Hi friends,

The Wouxun radios use a CPU chip which includes 16k of 13-bit memory (see data sheet at http://www.emc.com.tw/eng/database/Data_Sheet/COM/EM78P568.pdf). The run-time system most likely resides either mostly or totally on the read-only memory on the chip.

A separate EEPROM chip in the radio stores channel attributes (e.g. freq.), channel labels, frequency limits of the radio, the frequency and other attributes for VFO A and VFO B, FM broadcast memory frequencies, and global attributes (such as squelch levels). The EEPROM also stores the band limits which can be changed with the unlocking program.

The "tw" file contains some of the information in the EEPROM, but not all of it. For example, the "tw" file does not include band limit or FM broadcast channel info.

You can open the "tw" file with DEBUG (which comes with Windows), and you can read and write the entire 8kb EEPROM with the Linux software which has been discussed in this group.

The "Welcome" message is definitely not written to or read from the radio with the Wouxun programming software.

I don't know whether it is in the EEPROM. Note that for channel labels Wouxun does not encode the labels in ASCII. Rather, byte values 0 through 9(decimal) are the ten digits, and the next 26 codes are for the capital letters (10 decimal through 35 decimal). Codes 36 through 38 decimal are "+", "?", and space (I don't remember whether "+" or "?" comes first.)

David / K7DB

The older version that I was using had an interesting side-effect, I had to set both bands to the same 'mode'. That is to say both had to be in "Freq" or "Ch" or whatever. If you changed one, the other also changed. With the newer version, each band can be set independently.

Is it possible to program two seperate band plans into the KG-UVD1? Whenever I program one band, the other is programmed with the same plan.

2208. Re: [Wouxun_KG-UVD1] Dual Band

Yahoo group: Wouxun_Radios (2009 — 2010)

From: Barry A. Baines
Topic: 2207 Message: 2208

Keep in mind that there two identical VFOs, not two 'bands' on this radio. Either VFO can handle VHF or UHF, so whatever is programmed into 128 channels memory channels is available on both VFOs.

Personally, I believe this gives great versatility versus traditional radios where each VFO is on a separate band. For example, it is really simple to program the radio for amateur satellites where two meters is used for the uplink and 70CM is used for the downlink. A single memory slot can handle both frequencies and the associated CTSS setting, irrespective of which VFO is used to recall that memory configuration.

FWIW,

Subject: [Wouxun_KG-UVD1] PL110.9 on VHF Receive

I have two KG-UVD1P's that do not receive when programmed for PL 110.9 on a VHF Freq but do work on a UHF Freq. Does anyone use the PL110.9 on VHF? Trying to figure out if its a problem on a batch of radios or just the two I have. They were both purchased the past month or so.

Just to clarify I have both encode and decode programmed for the 110.9 and I can key the repeater and see the repeater on the S meter but I can not hear it unless I press the monitor or disable the PL. I checked everything 10 times over and its not an operator error that I can tell.

On my mobile radio the 110.9 receives the same repeater just fine (its also just a few miles away so the signal is plenty strong).

Thanks

Being the owner of 4 Amateur, and 3 GMRS repeaters, I think I can clear this up.

ALL of my repeaters must receive a PL tone for the repeater to key up. NONE of my repeaters transmit a PL tone, and the repeater controller does not pass the tone from the mobiles and hand helds using it.

If you program a receive tone on your hand held, and my repeater does not transmit one, you will not hear the repeater. The tone opens the squelch. No tone, no breaking squelch. However, your mobile may not use the receive PL unless the mic is grounded, and will run carrier squelch if the mic is "off hook".

Does that help?

No. The repeater transmits a tone. On my mobile I have the receive pl programmed and it works fine. Same with my VX7R. The wouxun works fine on UHF repeater from dame club but on VHF does not.

Possibly those repeaters ARE running CTCSS on their output, and your local one doesn't. If you really don't want to hear the more distant ones, then you need to reduce your squelch. If your local one doesn't transmit CTCSS tone then that is your only hope - unless you can persuade your local repeater keeper to switch on the CTCSS!

I use CTCSS of 110.9 a lot, as my most-used repeater is GB3MP in North Wales. I don't use CTCSS on RX though (usually no need for it, and some repeaters don't transmit CTCSS) and you can just use the tome on TX, which should be no problem.

I have stated this a few times..... the local repeater DOES transmit a PL. My mobile and my VX7R have PL Programmed for receive and it works fine. Only the Wouxuns dont work. If this is a widespread problem with the Wouxuns I dont want replacements until its fixed as this repeater is the closest to my house (and others who will be buying the radio) and I can hit it easily with the HT while the other VHF repeaters are to far away and I have to stand outside to hit the one.

The one radio is about a month old and the second about a week and I only have so much time to return them if they are defective. The seller is great and will excahnge them but I dont want to get replacements with the same problem wasting his time. I also asked him to try and test a radio but if it is a widespread problem then Wouxun needs to know so they can correct it.

I tested 2 and my friend will test a 3rd today at lunch at work. Hopefully the seller can test another as well.

These are great little radios but this situation would kill the deal for me. My friend and I are testing these radios out and if they work out we will have a bunch of local hams/volunteer firemen buying them. Since the firemen are paying out of their pocket the price is ideal (the department only issues Motorola's to the officers not the rest of the guys). Many are hams as well so the radio's are perfect for them (very few can afford a Motorola). Out of several hundred firemen I would guess almost half will want to buy one (a couple two since they can use them for GMRS etc as well).

Again these are great radios (not a Motorola but thats ok) but they may have a bug to fix. Personally I will be getting 4 or 5 for GMRS use for the extended family over time.

You are dealing with a lot of variables here. The repeater you speak about may not have enough PL tone output for the Wouxum to decode. You might try programing your Wouxums in reverse and see if the will decode in tone squelch. If they do than the problem is with the pl output of the repeater. The PL output should be around .8 tenths of a micro volt. Sometimes repeater owner will turn down the so it can not be heard by ear. I have had problems like this in the past with community repeaters with lots of users and different radio brands. The repeater owner may want to reach a happy medium if this is the case. Jim

I agree that is possible.

On Aug 31, 2010, at 8:12 AM, JIM Rogers <n5vgq@...> wrote:

> You are dealing with a lot of variables here. The repeater you speak about may not have enough PL tone output for the Wouxum to decode. You might try programing your Wouxums in reverse and see if the will decode in tone squelch. If they do than the problem is with the pl output of the repeater. The PL output should be around .8 tenths of a micro volt. Sometimes repeater owner will turn down the so it can not be heard by ear. I have had problems like this in the past with community repeaters with lots of users and different radio brands. The repeater owner may want to reach a happy medium if this is the case. Jim

Okay, please forgive my wanting to double-check everything - could you check with one of your other rigs that the squelch does NOT open on your local repeater when your switch off CTCSS RX on the "working" rigs?

It may be a "batch fault" (is the CTCSS working correctly on other frequencies apart from 110.9) Also, I've just realised that my local 110.9 repeater may not be TXing the tone, as I think I programmed my rigs NOT to check for tone on RX, so my statement that the CTCSS works on RX may not be true. I'll try to set up my programming config and check that later today.

Subject: Re: [Wouxun_KG-UVD1] PL110.9 on VHF Receive

I have stated this a few times..... the local repeater DOES transmit a PL. My mobile and my VX7R have PL Programmed for receive and it works fine. Only the Wouxuns dont work. If this is a widespread problem with the Wouxuns I dont want replacements until its fixed as this repeater is the closest to my house (and others who will be buying the radio) and I can hit it easily with the HT while the other VHF repeaters are to far away and I have to stand outside to hit the one.

The one radio is about a month old and the second about a week and I only have so much time to return them if they are defective. The seller is great and will excahnge them but I dont want to get replacements with the same problem wasting his time. I also asked him to try and test a radio but if it is a widespread problem then Wouxun needs to know so they can correct it.

I tested 2 and my friend will test a 3rd today at lunch at work. Hopefully the seller can test another as well.

These are great little radios but this situation would kill the deal for me. My friend and I are testing these radios out and if they work out we will have a bunch of local hams/volunteer firemen buying them. Since the firemen are paying out of their pocket the price is ideal (the department only issues Motorola's to the officers not the rest of the guys). Many are hams as well so the radio's are perfect for them (very few can afford a Motorola). Out of several hundred firemen I would guess almost half will want to buy one (a couple two since they can use them for GMRS etc as well).

Again these are great radios (not a Motorola but thats ok) but they may have a bug to fix. Personally I will be getting 4 or 5 for GMRS use for the extended family over time.

□

Possibly those repeaters ARE running CTCSS on their output, and your local one doesn't. If you really don't want to hear the more distant ones, then you need to reduce your squelch. If your local one doesn't transmit CTCSS tone then that is your only hope - unless you can persuade your local repeater keeper to switch on the CTCSS!

I just set up my Kenwood D7 to Tx with a 110.9 and set my KG-UVD1P to Rx with tone. With tone, the Rx works. I changed to another tone and NO Rx. So, mine appears to work correctly.

The car radio has much greater range and I only hear the other stations if I use the monitor feature so I assume the pl tone is opening the squelch.

Had a friend try his and same problem on his Wouxun. This may be a show stopper for using this radio. So we have 3 if 3 Wouxuns that do not work but my kenwood tm-v7a, my vx7r, my friends kenwood HT all work fine.

Again on UHF repeater same locatio it works.

To bad as thus seemed like a great radio. We may order some Puxing's ti try them instead.

My repeater doesn’t have 110.9 pl tone, but it does have both RX and TX of 103.5 tones. My UDV1P works fine. With R-CTC enabled and set for 103.5, it receives our local repeater just fine. With it either in the OFF position or set to a different tone, it does not open the squelch on the radio. Encoding enabled, it keys the repeater, encoding disabled it does not key the repeater.

Wouxun works fine here.

Excuse me, obviously in the Off position, it receives the repeater. Typed ahead of myself. If the R-CTC is set to a tone other then our 103.5, it does not open the squelch. With it set to 103.5, it opens the squelch just fine. With it off, it receives the repeater (of course) just fine. Encoding works as well.

Had a friend try his and same problem on his Wouxun. This may be a show stopper for using this radio. So we have 3 if 3 Wouxuns that do not work but my kenwood tm-v7a, my vx7r, my friends kenwood HT all work fine.

Again on UHF repeater same locatio it works.

To bad as thus seemed like a great radio. We may order some Puxing's ti try them instead.

On Aug 31, 2010, at 10:33 AM, "jwheatleyus" <taoswheat@...> wrote:

I just set up my Kenwood D7 to Tx with a 110.9 and set my KG-UVD1P to Rx with tone. With tone, the Rx works. I changed to another tone and NO Rx. So, mine appears to work correctly.

If the radio is also hearing a distant repeater if may being hearing that signal in addition to the desired one and not able to decode the PL you desire thus keeping the receiver muted. Have you tried to program another radio on simplex at the output frequency of the repeater using the PL tone and then transmit with it to see if the Wouxun will decode that way? If it does decode then it would appear the repeater output PL is at issue as others have mentioned.

Receives just fine with pl disabled,however, the receiver is also picking up a distant repeater that I don't want to hear.

I had two radios sitting on the desk, an older UVD1P and a new-from-the-box UVD2. I programmed 4 channels into each with various combinations of 110.9 Decode and Encode. I tried all combinations and each one worked as they should.

We have many other freq programmed with other tones and they are fine. Either a bad batch of radios or the radios can not handle the situation. Either way some people will just not use the Wouxuns.

Thanks for all the time guys! We appreciate the help!

I have tried it on both radios and they work fine..... Bear in mind, this was direct radio to radio, NOT using a repeater.

That's a good thought! You say you have 2 or 3 radios there? If so, program one for "reverse repeater", complete with the CTCSS, and see if you can work the two radios to each other.
If so - things are good - and there's a problem with the repeater (such as the amount of tone modulation)
If not - then there's a "batch problem" with your Wouxons.

One other thing - did you buy the radios direct from China - or from a US dealer?

I have tried it on both radios and they work fine..... Bear in mind, this was
direct radio to radio, NOT using a repeater.

Bought in the USA. The dealer is more than happy to help but I doubt there us anything he can do. If the radios don't work with this repeater then that is that. The people who want to use that repeater will just use another brand. So far this us the only brand that does not work that we know of.

No radio is perfect. I still think these are great radios for the money.

In case there is I am referring to the Great South Bay repeater in Babylon Town Hall Emergency Operation Center.

146.650 with a negative split and 110.9 Pl

It's not that big of a deal there are other radios to choose from for those people that want to use thus particular repeater. I think the Puxing might even be cheaper but we were trying to buy a radio from USA distributor. The distributor has been helpful and this situation is beyond his control. We will still buy some Wouxuns just not as many. It's a great radio other than this quirk.

From what I've seen, it looks like it could be a quirk of the repeater, rather than the Wouxon. It would be worth talking to the repeater keeper - I assume from the frequency it's a ham who would be the keeper.

Might just be an adjustment on the audio/tone setting on the repeater.

I think if it was more than one brand of radio they would. Again I don't want to blow this out of proportion. The Wouxuns are a great radio but at least in this one situation they are not the right radio.

This is why the guys are trying a few before diving in and making a group purchase.

Has someone looked at the repeater output on a service monitor and checked that the PL tone is at least 750Hz deviation?

It could as simple as tweeking the PL tone level a tiny bit.

Good Luck

WA2NCH

In case there is I am referring to the Great South Bay repeater in Babylon Town Hall Emergency Operation Center.

146.650 with a negative split and 110.9 Pl

It's not that big of a deal there are other radios to choose from for those people that want to use thus particular repeater. I think the Puxing might even be cheaper but we were trying to buy a radio from USA distributor. The distributor has been helpful and this situation is beyond his control. We will still buy some Wouxuns just not as many. It's a great radio other than this quirk.

Bought in the USA. The dealer is more than happy to help but I doubt there us anything he can do. If the radios don't work with this repeater then that is that. The people who want to use that repeater will just use another brand. So far this us the only brand that does not work that we know of.

No radio is perfect. I still think these are great radios for the money.

That's a good thought! You say you have 2 or 3 radios there? If so, program one for "reverse repeater", complete with the CTCSS, and see if you can work the two radios to each other.
If so - things are good - and there's a problem with the repeater (such as the amount of tone modulation)
If not - then there's a "batch problem" with your Wouxons.

One other thing - did you buy the radios direct from China - or from a US dealer?

I have tried it on both radios and they work fine..... Bear in mind, this was
direct radio to radio, NOT using a repeater.

One radio was from China, the other from Ed. I used them both radio-to-radio on simplex. There are no repeaters here with this pl. Both radios communicated fine with full pl xmit and receive.

A note: A local repeater here has its PL tone set a little low, so some radios cannot hear the PL. (My Wouxuns BOTH hear it fine)

ALSO.... My Wouxuns, Sometimes cannot hear my 123 hz pl from my echolink node...IF my node transmitter is getting flaky.....

I just think these radios have such a tight tolerance that if there are any anomilies from the transmitting station, they could be missed... No fault to the Woxuns.... more the fault of the transmitter.

I think if it was more than one brand of radio they would. Again I don't want to blow this out of proportion. The Wouxuns are a great radio but at least in this one situation they are not the right radio.

This is why the guys are trying a few before diving in and making a group purchase.

There are many hams here at work and we are about a mile or so from the repeater. At the moment there are probably 4 or 5 HT's in the building other than Wouxun and they all work. There are probably as many or more mobiles in the parking lot that work fine with the repeater. The repeater had a NET meeting last night with a lot if people checking in etc. If nobody else is complaining about thus problem from another brand of radio our opinion is it's the limitation of the Wouxun.

We have a LOT if engineering experience in this group. When time permits we may take a unit and dig into this more. Fir now we are looking for an off the shelf radio that will work for all applications and do a group buy.

Subject: Re: [Wouxun_KG-UVD1] Re: Poor transmit audio

I've just tried measuring the transmit audio response of various radios I have here. Should have done this before I modified the Wouxun but unfortunately I didn't.
I used my HP8920 test set to measure the deviation and an HP 3552A as the audio generator. The first set of measurements were done through the external MIC connector and the level was set at 1KHZ to give 1KHz deviation on the 8920.
The second set of measurements was done by connecting a small over the ear headphone to the 3552A. The headphone was clamped over the radio microphone hole and adjusted for best coupling.
The two Yaesu radios were only measured by coupling the headphone over the mic as I didn't have a suitable lead for direct connection.
The results confirm the on air reports of audio quality with the Yaesu VX6 being by far the worst sounding handheld I have used! The VX5 and Kenwood TH215 always get good reports with the TH215 slightly lacking in low frequencies. Not bad for a radio that is now more than 25 years old and still working very well. Its microphone is a bit sensitive and this would account for the higher readings referenced to 1KHz as the low frequency roll off probably gives the higher deviation readings at the higher frequencies.
I hope the formatting of the results does not make it too difficult to decipher!

Here's the results:

Handheld frequency response test

All tests referenced to 1KHz tone at 1KHz deviation, 147.575MHz at lowest radio power setting.

These measurements were direct in to the external mic connector:

Frequency 1.5KHz 2KHz 2.5KHz 3KHz Level at 1KHz

Radio
Kenwood TH215 1.42 1.87 2.3 2.48 -52.4

Quansheng TGUV 1.4 1.7 1.88 1.93 -48.8

Wouxun UVD1P 1.46 1.82 2.04 2.15 -50.7

Feidaxin FD150 1.4 1.67 1.84 1.97 -59.7

These measurements were made by close coupling a small headphone over the radio microphone:

Kenwood TH215 2.0 2.7 3.6 4.5 3.3

Quansheng TGUV 1.29 1.85 2.13 2.98 -6.3

Wouxun UVD1P 1.32 1.6 1.79 2.1 8.6

Feidaxin 150 1.83 2.67 2.7 2.9 3.8

Yaesu VX5 1.3 1.8 2.5 2.8 -2.8

Yaesu VX6 1.2 1.25 1.35 1.48 -1.2

Realizing, of course, that these radios are not approved for Part 95 (GMRS/MURS) use. (Not that there is a lot of enforcement, but to be forewarned is to be forearmed.) They are approved for Part 90 (LMR) use, and can also be used under Part 97 (Amateur).

How to fix a tone problem.

set service monitor to desired frequency .

set tone to proper level and frequency.

hook radio to service monitor and check .

if radio receives OK reduce tone level till receiver mutes to check the range or operation,

if radio passes this test radio it is OK it is time to look else where.

if the radio fails the test it time to fix the radio.

2250. External Mic & Speaker

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-08-31 23:15:58 UTC
From: zl2ke_steve
Topic: 2250 Message: 2250

What type of plugs are required to have an external mic and speaker? I can see that the smaller diameter plug is the speaker and the larger
diameter is the microphone, as is marked on the black plastic covering the sockets.

Are they 2.5 and 3.5 mm plugs?

Do I need to use stereo plugs (sectioned in 3 parts) or will mono / dual section plugs work? Maybe the stereo plugs are only necessary for the USB computer connection?

Thanks Steve ZL2KE

If you need a cable with proper connector and solder pig tails, Argent Data makes a nice one for about $6.

I'm going to purchase a couple Wouxun handhelds for ham use, one for 2M/220 and the other for 2M/440 (I'm in the US).

Their China site says the KG-UVD1P is the latest, but "Wouxun.us" says that the KG-UV2D is the latest one. What is the latest model for US ham usage?

Also, when I go to the "Wouxun.us" site (or search for it on Google), Norton Antivirus says it has two viruses on it. Is anyone else getting a Norton Antivirus warning for this site?

As far as I know the 2D version is a custom build for the Wouxun.us site. I believe the only difference is that those have a modification in the firmware that brings the radio up in memory name mode by default. There could be other minor changes that I can't remember. I am sure Ed will chime in here to clarify.

I went to the Wouxon.us site as you linked and got no warning and I have Norton as well. The KG-UV2D as I understand is the latest model. I saw already one of the KG-UV2D models for sale on a used equipment list on QTH.com classified adds earlier tonight. Only used once.

It's likely that the display text is in the firmware in read-only memory on the CPU chip.

If that is indeed the case, then your friend will need to write a program in the language used in the EM78P568-44 CPU chip, burn the ROM in a new CPU chip, unsolder the old CPU chip, and solder in the new one. Your friend might want to refer to the data sheet for the chip (which includes the instruction set) -- you can find it at http://www.emc.com.tw/eng/database/Data_Sheet/COM/EM78P568.pdf.

In the files section of this group is a pdf file of the modulation mod.
I should have added that the measurements in my post were of the transmit audio with no matching de-emphasis on the test equipment so there should be a rising response of 6dB per octave from the pre-emphasis network in the transmit audio section.
Instead of removing the capacitors mentioned in the mod, I carefully cut the pc board trace to the capacitors so I could repturn the radio to its original condition if required.

norton. as you have found it false positives a LOT, and it's a massive resource hog. There are many FREE options that perform MUCH better than norton and mcaffee.

i work in IT and we have banned norton and mcafee from the sites. Too many headaches and too many real viri tend to slip past them.

I would not be too hasty blaming the radio for poor audio. If you have two identical units operated the same then perhaps there is a problem. The simple fix would be to re-adjust the modulation control. Don't do modifications unless they are necessary and you have the skill. These are tiny boards.

My experience from my land mobile days is some users, especially taxi drivers mumble at the microphone which is usually some distance from their mouth. I pick up the mike. hold it about an inch from my lip and speak in a slightly louder than conversation voice level and deafen the whole lot.

Also some radios and some voices just don't work well together.

2271. KG-UVD1 direct from China FCC sticker?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-02 12:34:39 UTC
From: Garrett
Topic: 2271 Message: 2271

Do the radios that are shipped direct from China or Hong Kong from vendors such as 409shop.com have FCC labels attached? I know the ones from Wouxun.us do, but 409shop has them for as little as $105 shipped per radio. My experience with this company and Puxing radios, is that they include a printed copy of the FCC cert but no sticker. These radios will be for a commercial application, so I would prefer the stickers be there.

Gordon,

With sincere respect I differ with your statement nobody gives a rat's ass.
We DO give a rat's ass. That's exactly the problem with radio users and the FCC is beginning to recognize it with their recent NPRM against GMRS Part 95.

I do agree with your first statement - print your own sticker.

For those who do need a sticker, I am attaching a MS-Word document I use when Wouxun forgets to apply one to the radio. It must be applied inside the battery area below the contacts. I apply mine just below the word Wouxun.

Just cut one or more out and use clear tape to apply it to the radio case.

I apply one to each radio I sell that Wouxun missed applying one to.

Ed

You pay a few bucks more from the US dealer, but trust me. When you need the radio fixed or warranty service you do NOT want to pay for shipping to China.

As far as the sticker goes.....its a sticker. The FCC has better things to do than check your radios for one.. I've been using commercial equipment for ham use for years and none of it was type accepted for ham use.

Do the radios that are shipped direct from China or Hong Kong from vendors such as 409shop.com have FCC labels attached? I know the ones from Wouxun.us do, but 409shop has them for as little as $105 shipped per radio. My experience with this company and Puxing radios, is that they include a printed copy of the FCC cert but no sticker. These radios will be for a commercial application, so I would prefer the stickers be there.

That's certainly Customer Service - especially as probably half of us bought our radios direct!

(Now that we have a dealer in UK, I'll be paying a little more when I buy one for my XYL (as soon as she has passed her test!) and getting it from ML&S or another UK distributor.

Gordon,

With sincere respect I differ with your statement nobody gives a rat's ass.
We DO give a rat's ass. That's exactly the problem with radio users and the FCC is beginning to recognize it with their recent NPRM against GMRS Part 95.

I do agree with your first statement - print your own sticker.

For those who do need a sticker, I am attaching a MS-Word document I use when Wouxun forgets to apply one to the radio. It must be applied inside the battery area below the contacts. I apply mine just below the word Wouxun.

Just cut one or more out and use clear tape to apply it to the radio case.

I apply one to each radio I sell that Wouxun missed applying one to.

Ed

You pay a few bucks more from the US dealer, but trust me. When you need the radio fixed or warranty service you do NOT want to pay for shipping to China.

As far as the sticker goes.....its a sticker. The FCC has better things to do than check your radios for one.. I've been using commercial equipment for ham use for years and none of it was type accepted for ham use.

Do you mean it is editable to change WELCOME (PONMSG feature) with
individual name or calling sign or area/country/CITY via programming ???

2279. What's in the "tw" files, and what's in the KG-UVD1P EEPROM

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-02 20:03:28 UTC
From: David A. Behar
Topic: 2192 Message: 2279

Hi friends,

There has been some discussion about changing welcome text and perhaps other characteristics of the radio. I've analyzed the "tw" file format, and also the entire EEPROM image (which can be downloaded with the Linux software regarding which there have been posts in this group).

The "tw" file pretty-much has just the info that you can modify using the Wouxun programming software, and this is a subset of what is in the radio's 8 Kbyte EEPROM. As an example of what else is in the "tw" file, it does have info on what channel numbers will be displayed on the radio immediately after downloading to the radio.

The EEPROM has everything that is in the "tw" file, plus at least two more categories of information. First, it has the band limits that are programmed with the unlocking software. And second, it has the frequencies for the 18 FM broadcast channels which can be stored in the radio.

In addition, there is a little bit of information in the EEPROM that I have not figured out -- at least not yet. Of the 512 16-byte blocks in the file, I understand the usage of all of them except 13. All I know about these is that there is some kind of data in these blocks, and they are in 3 "chunks" --at 0x0910, 0x0980, and 0x1910.

And there are 230 16-byte blocks in the EEPROM which are all 0xFF -- i.e., all bits turned on -- so I guess that these are not used for anything.

If you'd like to try to figure out what is in the 13 mystery blocks, let me know what you figure out -- the contents of these blocks in my radio (at least when I uploaded the EEPROM contents to my computer) appears below.

David

My ass contains no rat, however I would give one if I had one to give :)
I agree, Ed. The blatant disregard for equipment (and other) FCC requlations is appalling, especially from folks who should know better.
Any responsible adult (as well as amateur radio operator) shoul;d be aware of and in compliance with such rules.

96 percent (a guess) of all radios you see on Ebay from China do NOT have an FCC ID... as such cannot be legally sold, imported into, or used by ANY person in the us, ham license or not.

Thanks for the labels! I'll crank a page out on my wife's inkjet and apply one to the Non-Ed radio I have, so both have the ID physically attached :)

You don't need type-acceptance for ham use.... just as long as the radio is
type-accepted for another service.... and has an FCC id on it (this rule though
took effect in the 80s??) so some legal stuff made before then is still okay,
The Part 15 "approval" is the key....on commercially made gear... our Wouxuns
have Part 90 Acceptance, so that makes them compliant with Part 15, as all
equipment made by companies must at least have part 15 compliance to be legal.

Thanks for the labels! I'll crank a page out on my wife's inkjet and apply one to the Non-Ed radio I have, so both have the ID physically attached :)

Your attachment didn't come through. A lot of the yahoo groups don't allow attachments. Could you post it in the files section for those that don't have one. Thanks.

My ass contains no rat, however I would give one if I had one to give :)

I agree, Ed. The blatant disregard for equipment (and other) FCC requlations is

appalling, especially from folks who should know better.

Any responsible adult (as well as amateur radio operator) shoul;d be aware of

and in compliance with such rules.

96 percent (a guess) of all radios you see on Ebay from China do NOT have an FCC

ID... as such cannot be legally sold, imported into, or used by ANY person in

the us, ham license or not.

Gordon,

With sincere respect I differ with your statement nobody gives a rat's ass.
We DO give a rat's ass. That's exactly the problem with radio users and the FCC is beginning to recognize it with their recent NPRM against GMRS Part 95.

I do agree with your first statement - print your own sticker.

For those who do need a sticker, I am attaching a MS-Word document I use when Wouxun forgets to apply one to the radio. It must be applied inside the battery area below the contacts. I apply mine just below the word Wouxun.

Just cut one or more out and use clear tape to apply it to the radio case.

I apply one to each radio I sell that Wouxun missed applying one to.

Ed

Hi Ed:
  I was one of those that did not get the attachment of the FCC Sticker. I read that it was posted to the Wouxon Yahoo group site so I went there and did not see it. Unless it is listed under a filename that maybe I missed but I didn't see any file stating FCC Sticker or a facsimile of that wording anywhere in the file section. Could you clarifiy how it is listed so that myself and others can find it. I would most appreciate it. Thanks.

Les,

I'm sorry. I uploaded it to another similar-name yahoogroups (Wouxun_KG-UVD1P).
My thanks to Brad for doing it successfully here for me. The file is now in the <Files> section. Check it out.

You will also note the entire page is filled with labels. That is so I save paper when I need a label. I print the entire sheet and take clear packing tape and run three columns of tape down the entire page covering the printed labels. Then they are already laminated for applying to the radio.

The other method is to cut one out and THEN use clear tape which will result in one layer of tape over the label instead.

Good luck.

Ed

Hi Ed:
  I was one of those that did not get the attachment of the FCC Sticker. I read that it was posted to the Wouxon Yahoo group site so I went there and did not see it. Unless it is listed under a filename that maybe I missed but I didn't see any file stating FCC Sticker or a facsimile of that wording anywhere in the file section. Could you clarifiy how it is listed so that myself and others can find it. I would most appreciate it. Thanks.

Topic: 2313 Message: 2313

Has anyone else ran into the radio not hearing the 151.00 to 152.00
it well tx but no recive 151.625 with pl of 100.0
151.49
151.505
151.94
using Motorola and the wouxun 777 they both work togather

2314. Re: no recive on 151.625 pl 100.0

If you know someone with a service monitor get them to check it for you.

also try 151.625 without the tone programed

If it dons not pass the receive test with the service monitor it needs a trip to the factory or a service center.

Hello,

The latest version of KG-UVD1P is already updated to work normally on this frequency point. Your HT may be the older version.

At the Huntsville Ham Fest, the ALA. dealer was selling them for $129 plus tax.

At the Shelby/Dallas Ham Fest, one dealer was selling the UVD2 for $107 plus tax, and another NC dealer was selling the UVd1 for $105 plus tax.

Competition is good.

I hope Wouxun puts the $30 DSTAR CODEX chip in an HT and sells a DSTAR HT for $200.

I'd buy one or two with a chip that could do codec2 if they made it.

Topic: 2271 Message: 2323

It's funny how a person would place everything on a price tag. I guess that's human nature but for me, I look at the total picture.

For example: My price for a radio is $135. Hmm, WOW, you say. I'd never buy one from that dealer. But see, you don't have all the facts to make that decision on - you only have one piece of the picture and that piece is the price.

My price includes with EVERY sale the following:
The radio with standard accessories that come included which are

1300mAh Li-ion battery,
belt clip,
wrist strap,
desk charger w/
a/c cord, and
owners manual.

In addition to these, I also include

a 1700mAh Li-ion battery,
belt clip for additional battery,
USB programming cable,
DC charging cord,
SMA/BNC antenna adapter, and
programming software on two mini CDs (one programming software and other programming drivers).

That's $52 worth of additional accessories not normally included in the purchase of a radio. So if you were to deduct the $52 from the $135 retail price on the total package, you are receiving the radio for $83 with the standard accessories included. Now THAT's a deal!

My philosophy is that if you include everything a person will probably want when he/she buys a radio then they are satisfied and fit for anything that comes up. Yes, there are also additional accessories available such as spkr/mic, headset, holster, etc. but those are not in the mainstream of consumer wants.

When you are looking for competition regarding the Wouxun you will have to look hard and far because there is so little room for a profit that the prices are pretty much set as low as they are going to get. Is there really a difference between $107 and $105? Does that make or break a deal? I don't think so.

When I'm in business, it's all about 1) customer service first, 2) controlling overhead second, and 3) making a profit to cover the aforementioned overhead. The number 4) is making it enjoyable and having a product you believe in. If it's not fun, choose a different line. I'm lucky since I'm retired and do this as my long-time hobby having been active in communications over 50 years.

Yeah.. i just heard about Codec2. I figured someone would find a work-around
for those proprietary digital codec folks.... open source codec..... if Dstar
compatible ... good... if not.. a third player.
Whoever cheaper wins!

2327. wouxun ht and Rigblaster Nomic? and other idea.

Yahoo group: Wouxun_Radios (2009 — 2010)

From: John
Topic: 2327 Message: 2327

Ok... over the next couple days gonna try hooking up my ht with my Rigblaster Nomic...

I got the 4 wire cable everyone is talking about....(Kenwood speaker mic cable) Any ideas.

My idea...

Take cable ground as well as PTT and audio out and solder to "GNDTIE" on Nomic... all grounds tied together. Then take PTT and MIC and solder to appropriate leads on cable. The remaining wire on cable will go to audio out on my cable going into soundcard input (with ground wire also going to GNDTIE)

Doable?

This is a soundcard interface, taking PTT signal off of the computer's serial port.

As an alternate:

Simply take TWO audio cables... one attached to the mic, and the other the speaker out on the kenwood cable, then tying grounds together.

Set radio To VOX, and set the appropriate delays on my packet program to compensate for vox delay.

AGWPE is used for my soundcard tnc, with AGWterm as my terminal.

Thoughts?

So true I would love the idea a D-Star chip in a Wouxun.
To be quite honest my KG-UV2D is the best HT I have ever had the pleasure of owning.
The 92AD I have sitting here is collecting dust and thinking of selling it.
Not to be taken as a slam on Icom but not a lot of D-Star activity here.
To combine the digital chip with a Wouxun you would have back order issues unlike any dealer would have ever seen.
Then the law suit from Icom but that issue we won't discuss here.
I love your idea though a inexpensive HT with analog and digital modes would be awsome.

According to wikipedia, ICOM has trademarked dstar but I don't think that the protocol itself is under IP law. I believe that is an open protocol published by the JARL (original developers of the dstar system) Although the audio codec is a proprietary one that can only be used by integrating a proprietary chip from DVSINC.

It's entirely possible that Wouxun could buy the $25 chips and make a dstar radio although they might not call it dstar. They could call it dstar-compatible probably. Or they could make a chip that works with the codec2 code (now out in an alpha release) for the codec. Or both, that'd be fun.

Well, that isn't encouraging.... BUT it is information I have asked for... I will proceed slowly and gently... I do not want to ruin my Nomic, radio, or computer.
Your input is appreciated. I may proceed with my second option first. I want to take it in stages... first to see if I can decode messages... then connect the transmit capability.

Of course, the end result will be posted for all to enjoy :)

This looks quite straightforward with the Signalink anyway -

From http://www.tigertronics.com/sl_wireht.htm :
"Separate Mic and PTT Lines - This configuration is usually found only on Kenwood hand-helds. If your HT has separate Mic and PTT lines, then it can be connected to the SignaLink just like any base or mobile radio. No external capacitor or resistor is needed. Click here to view jumper settings and a typical cable wiring diagram for this type of HT.
"

Wiring config:
http://www.tigertronics.com/sl_wireht_sep.htm

Let us know how you get on using the vox function - it sounds like an innovative solution :)

Cheers,
Dave

Decode is the easy part and only requires audio from the radio. The problem was not so much that it couldn't be done as much as there was no easy way to produce a commercially viable cable for us to sell. There are issues in the way that audio and ptt are routed.

Ed,
Unfortunately, not all of us need these accessories either. I already had a compatible cable, software is easily downloaded, and I do not need the extra capacity battery or the DC charger. Yes, you make a nice deal for someone who needs this stuff, but I bet you could sell a lot more if you offered just the radio. Imagine how many folks buy more than one radio, they usually only need one programming cable and not one for each unit.

From: David A. Behar
Topic: 2336 Message: 2336

Hi,

The FM radio channels can't be programmed with the Wouxun programming software.

However, the FM radio frequencies are stored in the radio's EEPROM, and the Linux tool can be used to read and write the entire EEPROM memory space -- see the postings about the tool on the [Wouxun_KG-UVD1] group. But you would need to provide your own tool for editing the EEPROM memory image, as the developers who put together the Linux tool provided a rudimentary ability to edit only the transceiver channel parameters.

I have had some success putting together a prototype Excel spreadsheet with which I am able to edit channel info in the "tw" file, and I will be able to easily change some parameters in the spreadsheet to edit the EEPROM image files (which are not in the same format as the "tw" files). As I am able I will add the ability to change all changeable parameters.

Also, I am working with another developer to possibly create another programming option.

If you want to play with programming FM broadcast channels, here is technical info:
Each FM channel is stored as a two-byte integer, with the HIGH byte first.
The nine "Team 1" channels are stored in 18 bytes starting at 0x0842.
The nine "Team 2" channels are stored in 18 bytes starting at 0x0882.
The two byte integer value is in units of 100 kHz above 76.0 mHz.
Example:
Frequency of 88.3 to be stored in Team 1 channel 3.
Channel 3 is stored 4 bytes (offset of two channels of two bytes each) above the Team 1 base of 0x0842 = address 0x0846
(88.3 mHz - 76.0 mHz)/(100 kHz) = 123 decimal = 0x7B
Value is stored as:
Address 0x0846, high byte value 0x7
Address 0x0847, low byte value 0xB
David

Garrett,

I like your logic but I have a particular target I cater to - volunteers. I seek "newbees" into ham radio that want a good HT and want to be able to program it without sending it to a dealer to pay for programming it every time. My prime customers are REACT, CERT, and RACES customers.

I understand about having an extra programming cable, etc. but have you ever lost one and wished at that very moment you had a spare in a drawer somewhere?

When I order from china I order the same quantity of everything including accessories. If someone doesn't wish to have a particular item then I am not above a little hacking here and there. After all, I also service present Wouxun owners who need an accessory they didn't think to acquire when they got their original Wouxun so it balances out. Here's my best response however. Since you are receiving the radio for $83 in this package deal, anything you don't want, give it away to another ham friend. You're still ahead and some day that ham may just give you the very item you have wanted and couldn't fine - like a pristine D104. :)

Ed

FM broadcast channels can be saved from the keypad.
Tune desired freq.
Press "Menu" key.
display will show "save?"
press 1-9 on keypad to store.
to recall station stored in location 1 press 1........

Whoops!

Yes, of course the FM frequencies can also be saved to any of the 18 FM broadcast memories, as Ken has pointed out.

You can switch between two banks of nine channels each. When you are in FM broadcast mode, the pound-sign key will switch betwen the two banks of nine channels (which are identified as "Team 1" and "Team 2").

In the radio's manual, the discussoin on Menu 20 describes the process in detail (in flawless Chinglish).

Will this work with the UVD1? Apparently it has volume on it too... will
the volume function work?

oh and does it have channel up down too? the
one that came with the mic crapped out on me =/

With Kenwood plugs it certainly should. From the specs at the provided Google site I don't see any features like volume or channel selection. Simply appears to be an expensive named brand speaker/mic.

there is not any volume control on this model plus i dont see any control buttons. if you want volume control i suggest getting SMC-34
i have one and it works fine. but the buttons on the speaker mics dont work for the wouxun ht none of the hand mics that have buttons let you do anything. I just dont think the ht is programmed for it.

The KMC-21 is a Kenwood brand Speaker/Mic. It does NOT have a volume control. but I have seen several sites that claim it includes volume erroneously. The Kenwood KMC-34 does have a volume control, but the speaker is very poor quality and not loud enough for my old ears with the KG-UVD1P.

Suggest you look at some of the inexpensive Speaker/Mics on eBay. Anyone listed for Kenwood will work with the Kg-UVD1P.
Here is an example--
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=160363333294&ssPageName=STRK:MEWAX:IT
There are cheaper ones also.

I just received a speaker/mic from Ed (see www.wouxun.us)and I'm pleased with this one for $14+shipping.

Good strong receive audio and the transmit audio is good also. The cord seems to be long enough.. I'm a big boy..6' and just a hair over XXX pounds..let's just say 3x is a normal t-shirt and I can put it on my belt and the cord stretches over my back and clips to my shirt pocket! But the mic has a external earpiece jack (have not tried it yet) and the connector to the radio fits real firm.

NOW, is it built as well as a KW or other "name" brand mics. probably not BUT it's $14. Audio and feel is more than adequate.

I also bought the leather case since I had dropped the radio and it's hard plastic case chipped just a little. The case does not look bad at all and it creates a nice looking package. All the knobs, antenna , mic jacks fit just fine and there's a hole for the mic on the radio face. There is a Velcro flap to open to drop the rig into the charger also

Another ham and myself ordered the cases, mics and he ordered a battery eliminator and I would order them again. BUT NO VOLUME OR CONTROL KNOBS ON THESE EITHER!

You can program CTCSS (or PL if you think Motorola) into Tx and Rx for a memory channel, however I do not know of a way to program DTMF tones. To send DTMF just press the desired keys while transmitting.

I use the PC to program my memories too Jerry, so that isn't a problem in itself. Do you have DTMF tones stored though?

The Wouxon software only appears to have facility to store CTCSS/DCS tones into individual channels, not DTMF.

I have seen some of the china mad radios with up to 10 programmable slots for dtmf but I think the wouxun does not do it. The ones I have see let you assign an channel to the encode process if your wanting to use dtmf like 2 tone i havent seen a rig that has dtmf decode yet but someone may make one

Hi Steve,

Don't confuse PL (I think that's what we call CTCSS tones in UK - the low-frequency tones that keep repeaters open) with the DTMF. There obviously appears to be a problem for those who want/need to add different DTMF tones to different channels (I'm not sure why they need this)

CTCSS aka PL tones work fine except for one guy's repeater and I think this odd case has to be due to the repeater concerned, although he tells us that other HTs work fine with it.

The early model UVDs did apparently have too short a DTMF for some applications, but mine (bought about 6 months ago) and many other people have used DTMF for IRLP and works just fine. Wouxun made some changes but, I think when they went from UVD1 to UVD1-P (?), unfortunately the settings were presumably "hard coded" and not on programmable memory, so earlier buyers could not upgrade to the later version.

Certainly I'd give my UVD1-P a 5/5. Thanks for reminding me - I need to do an eHam review as well, as that's mostly where I got the information that persuaded me to buy one!

Stu (G3OCR)

HI Stu

Here in VK, we use DTMF extensively for control switching of our repeaters. In VK7 we have an extensive network of VHF and UHF repeaters that can be interlinked, giving virtually island-wide coverage -an area not much different to metroploitan France - from your handheld. A very handy feature.

In my particular situation, I want to command a UHF repeater near my airport to link to the major VHF repeater and while doing so, turn off its own repeater timeout. I need to do this so I can hear the weekly news broadcast on Sunday mornings, from the world's oldest amateur radio national body, which is relayed through the distant VHF repeater. I can do this manually, if I can ever remember the tone sequence required and if I can get it transmitted by the KG-UVD1P in the time allowed. It would be just so much easier to be able to program up the UHF repeater frequency pair, the CTCSS tone it also requires and the necessary switching DTMF sequence, then simply select that channel and PTT.

Some radios, such as one of the Alinco offerings, can mange this task.

I use the DTMF pad for both IRLP and EchoLink and never had a problem. I also use it to dial autopatch and use other features of the repeater. So not it is not usless.

Don't confuse PL (I think that's what we call CTCSS tones in UK - the low-frequency tones that keep repeaters open) with the DTMF. There obviously appears to be a problem for those who want/need to add different DTMF tones to different channels (I'm not sure why they need this)

CTCSS aka PL tones work fine except for one guy's repeater and I think this odd case has to be due to the repeater concerned, although he tells us that other HTs work fine with it.

The early model UVDs did apparently have too short a DTMF for some applications, but mine (bought about 6 months ago) and many other people have used DTMF for IRLP and works just fine. Wouxun made some changes but, I think when they went from UVD1 to UVD1-P (?), unfortunately the settings were presumably "hard coded" and not on programmable memory, so earlier buyers could not upgrade to the later version.

Certainly I'd give my UVD1-P a 5/5. Thanks for reminding me - I need to do an eHam review as well, as that's mostly where I got the information that persuaded me to buy one!

Wow Bill!

I'm very impressed with that level of control and switching - very flexible.

Just an idea that won't exactly make the Wouxun (or any other radio that isn't already capable) do what you want, but which would allow ANY radio to do the job. One of our club members was trying out an "automatic CQ Contest" gadget, and it seemed to work well (and save hoarse throats on 24-hour contests!).

I can't remember the chip he used, but it was capable of storing one longer (recorded voice audio) message or two shorter ones and to play them on demand. I think the chip only cost the equivalent of about $10. Probably a simple unit like that could be plugged into the MIC socket of any radio, with the DTMFs recorded into it, and sent out to trigger the required function.

Yes, I have had a similar thought myself and probably wouldn't even need to be plugged in to the mic socket if it had a small spaeker to produce the tones. We used telephone acoustic diallers and even mobile phones direct into the microphone to dial up DTMF on the Quansheng TG-25 and 45ATs, which lack any DTMF capabilities themselves. Worked but it was cumbersome.

Normal IRLP and Echlink tones probably aren't too difficult if they only entail numbers but the repeater control I need uses a sequence like *714A. It is the fact that I have to remember which keys represent the alpha characters that causes me to time out. I guess I'll learn eventually.

DTMF and PL are two different kinds of tones though!

Like has been said, the current models have tones that work correctly -
it's just the earliest UVD1Ps that don't.

A Brief tutorial on tones:

CTCSS (Continuous Tone Controlled Squelch System - or something like that) is a single low-frequency (around 80 to 120 Hz) at low deviation audio superimposed on the "communications" audio. I believe that this is what Northern America calls "PL" (WHY can't we all speak the same language when we speak "English" and avoid confusing the $h1t out of each other!?)

It is used to open (and sometimes to keep open) a communications path between 2 stations - often a repeater and someone connected to that repeater. It may be used initially to allow the squelch to open, or it may be required to allow the squelch to remain open. In the usual Ham application, this is to avoid a distant station opening a repeater or, worse, holding it open when there was a "lift" on. Different repeaters use different CTCSS tones to avoid this.

DTMF (Dual-Tone-Multi-Frequency signalling) is like the tones produced by your domestic phone to dial a number. A 2-sine-wave combination out of 8 tones produces the numbers 0 to 9, plus ~ and * keys. Optionally there are also keys for A, B, C, and D. This is domestically called "touch tone" dialling in the telephone application. This is what us hams use to "dial" IRLP connections (you could probably access IRLP by holding your telephone earpiece against your radio MIC and dialling the IRLP access numbers!). It would appear that it is also sometimes use to control our repeaters in other ways.

DTMF is what we are referring to when we talk about the "too short" tones on Wouxun radios of early build. Interestingly, the DTMF definition on Wikipedia says "The minimum duration of the tone should be at least 70 ms, although in some countries and applications DTMF receivers must be able to reliably detect DTMF tones as short as 45ms". I wonder how long the tones were on the Early Wouxuns, as it would appear that there is some flexibility in the spec?

Apologies to those who already knew all this and considered it "basics", but there are apparently some of our members who are confused by these terms.

Guys, not sure if this is useful, but a quick google for DTMF generator
came up with a number of software based solutions, including this one...
<http://www.tonetool.tk/>, referenced from
<http://hackaday.com/2010/03/29/dtmf-and-selcall-signal-generator/>

It advertises to have a sequence "address book", might be what your
after. It appears to run on a smart phone, so you don't have to be at
your computer desk. What that make it easier?

Kind Regards,

Lee

My suggestion was hardware based, but this could be another way to do it!

Guys, not sure if this is useful, but a quick google for DTMF generator
came up with a number of software based solutions, including this one...
<http://www.tonetool.tk/>, referenced from
<http://hackaday.com/2010/03/29/dtmf-and-selcall-signal-generator/>

It advertises to have a sequence "address book", might be what your
after. It appears to run on a smart phone, so you don't have to be at
your computer desk. What that make it easier?

Kind Regards,

Lee

CTCSS is called different things by different manufacturers.
Motorola- Private Line or PL
GE- Channel Guard or CG
RCA- Quiet Channel or QC

A lot of people in the US just call it tone or subtone.

Ben
W4WSM

>
> CTCSS (Continuous Tone Controlled Squelch System - or something like that) is a single low-frequency (around 80 to 120 Hz) at low deviation audio superimposed on the "communications" audio. I believe that this is what Northern America calls "PL" (WHY can't we all speak the same language when we speak "English" and avoid confusing the $h1t out of each other!?)

I use the PC to program my memories too Jerry, so that isn't a problem in
itself. Do you have DTMF tones stored though?

The Wouxon software only appears to have facility to store CTCSS/DCS tones
into individual channels, not DTMF.

Thanks for that Lee. Not sure that my iPhone will be able to run it but
very interesting, nonetheless. Yes, the address book concept would solve
my little issue.

There might be something similar in the iTunes offerings. I'll take a
look later.

As I seem to have inadvertently hi-jacked the "Useless" thtead, I have
changed the subject line slightly.

I use the program that came from Wouxon, Jerry. It is in a spreadsheet form, so I assume we are talking about the same thing.

It allows me to enter CTCSS, PL or whatever name we all know the sub-audible tones by but there is no field in the spreadsheet to enter DTMF or audible tones, at least that I can see?

2404. FCC Reg Changes

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-11 12:21:06 UTC
From: Rob Robinette
Topic: 2404 Message: 2404

I just received an ARRL newsletter that has a link to a story about proposed FCC reg changes. One is a ban on radios that can transmit on two or more types of services, such as FRS and GMRS or Ham bands and any other license
required frequencies. So stock up on your multi-use radios now.

Here is the part of the newsletter from the ARRL and it is targeting the PART 95 radios <http://www.tscm.com/47cfr95.pdf> Here is PART 97 radios <http://www.tscm.com/47cfr97.pdf>

73

John KO4XJ

The ARRL supports the Commission's proposal to prohibit the certification of radios that are intended to transmit on both Personal Radio Service channels and on Part 97 frequency allocations.

Noting that it is undesirable in general to combine transmit capability in radios intended for use in a licensed radio service with transmit capability in radios intended for use in a service licensed by rule -- such as the CB service -- the ARRL agreed with the Commission's finding that this invites unauthorized operation on frequencies allocated to the licensed radio service by users in the unlicensed service.

"An example is the marketing of radios which include both FRS and GMRS channel transmit capability," the ARRL explained in its comments. "This practice has resulted in numerous instances of operation by unlicensed individuals on GMRS frequencies. ARRL is very much concerned that instances of unlicensed operation on Amateur Radio frequencies, which create a difficult and time-consuming enforcement problem when they occur, would increase considerably if Part 95 equipment was permitted to include Amateur Radio frequencies as well." The ARRL strongly recommends that the Commission "continue to prohibit, without exception, the certification of Part 95 radios which include as well the capability to transmit on Amateur Radio frequencies."

There appear to be TWO chargers that work with the KG-UVD1P. The one shown plugs into the wall and has the charger electronics in the charger base. The other variety (mine) uses a wall wart that produces 12V and plugs into the charger base. The charger base has only a single LED that shows Red on charge and Green when finished. This charger also allows charging from a cigar lighter using a provided cable.

2412. RE: [Wouxun_KG-UVD1] FCC Reg Changes

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-11 17:09:47 UTC
From: Ed Greany
Topic: 2404 Message: 2412

John,

The example you quoted is from the ARRL's response to the recent FCC NPRM 10-119 and really has nothing to do with the Wouxun.

Remember, no matter how you may use your Wouxun, it is a BUSINESS Band radio - NOT a GMRS, Ham, FRS, or any other kind of radio. It is certified in Part 90, not 95 or 97. It just so happens that if one were to program it in the other bands it will work.

The ARRL is not anti-CB, anti-FRS, or anti-GMRS. They simply do not want combination radios with frequencies that are illegal or require a license combined with frequencies that do not require a license. Today's FRS/GMRS cloned bubblepacks are a perfect example whereby in a 22-channel radio, one must be licensed in GMRS to use certain channels while no license is required for other channels.

Ed

I saw this on the Qst web site the main thing that the so call 10 meeter radioes wer being coveted to class D CB frequencies a problem that has been around for a good long while. I think the part 90 approve radios are alive and well. Those Galaxy Dx 55 rigs may hav a problem if they change the rules.

John,

The example you quoted is from the ARRL's response to the recent FCC NPRM 10-119 and really has nothing to do with the Wouxun.

Remember, no matter how you may use your Wouxun, it is a BUSINESS Band radio - NOT a GMRS, Ham, FRS, or any other kind of radio. It is certified in Part 90, not 95 or 97. It just so happens that if one were to program it in the other bands it will work.

The ARRL is not anti-CB, anti-FRS, or anti-GMRS. They simply do not want combination radios with frequencies that are illegal or require a license combined with frequencies that do not require a license. Today's FRS/GMRS cloned bubblepacks are a perfect example whereby in a 22-channel radio, one must be licensed in GMRS to use certain channels while no license is required for other channels.

Here is the part of the newsletter from the ARRL and it is targeting the PART 95 radios
 Here is PART 97 radios
73
John KO4XJ

The ARRL supports the Commission’s proposal to prohibit the certification of radios that are intended to transmit on both Personal Radio Service channels and on Part 97 frequency allocations.
Noting that it is undesirable in general to combine transmit capability in radios intended for use in a licensed radio service with transmit capability in radios intended for use in a service licensed by rule -- such as the CB service -- the ARRL agreed with the Commission’s finding that this invites unauthorized operation on frequencies allocated to the licensed radio service by users in the unlicensed service.
“An example is the marketing of radios which include both FRS and GMRS channel transmit capability,” the ARRL explained in its comments. “This practice has resulted in numerous instances of operation by unlicensed individuals on GMRS frequencies. ARRL is very much concerned that instances of unlicensed operation on Amateur Radio frequencies, which create a difficult and time-consuming enforcement problem when they occur, would increase considerably if Part 95 equipment was permitted to include Amateur Radio frequencies as well.” The ARRL strongly recommends that the Commission “continue to prohibit, without exception, the certification of Part 95 radios which include as well the capability to transmit on Amateur Radio frequencies.”

I just received an ARRL newsletter that has a link to a story about
proposed FCC reg changes. One is a ban on radios that can transmit on
two or more types of services, such as FRS and GMRS or Ham bands and any
other license
required frequencies. So stock up on your multi-use radios now.

Yes.. These are rules for the USA only.

The "dual service" radios ruined GMRS.

I'm surprised the FCC approved them in the first place.... Now they are trying to correct their mistake...

Nothing new.

At any rate, does not affect our Wouxuns in any case.

AGAIN we seem to be confusing DTMF tones with CTCSS (PL) tones. Per my previous very detailed post, these ARE NOT the same thing!

As far as my software goes (the Wouxun software), this will work with CTCSS requirements but has NO FACILITIES for DTMF. Please stop confusing the two folks.

I use the program that came from Wouxon, Jerry. It is in a spreadsheet form, so I assume we are talking about the same thing.

It allows me to enter CTCSS, PL or whatever name we all know the sub-audible tones by but there is no field in the spreadsheet to enter DTMF or audible tones, at least that I can see?

I use the PC to program my memories too Jerry, so that isn't a problem in itself. Do you have DTMF tones stored though?

The Wouxon software only appears to have facility to store CTCSS/DCS tones into individual channels, not DTMF.

Anybody know if it is possible to add a DTMF code to a memory channel?
The ANSI-ID function looks as if it might do it but I then suspect it
will be applied to all memory channels, rather than just the one I need
it on?

This may be easier said than done. I can think of quite a few radios that are wide band by design and blocking bands would present the manufacturers with a challenge. Take your average 136-174 MHz radio. The amateur radio band is in there, what to do? I have a Motorola CM300 which overlaps the Family channels. Then there are CAP, MARS and CFARS channels that require Amateur Equipment to operate 'out of band' And all the airborne HF 2-30 MHz. Nice regulation but it may be unenforceable.

Someone may have already said this, I didn't read all the threads

I just saw some of these on ebay the other day. Seller listed it as a 10 meter radio but it looked like some pimped out trucker's CB. In the auction the guy hinted that it could be opened up. I emailed him and asked him about it and apparently it's a matter of opening the radio and changing a jumper. You don't even have to do any soldering.

I'm surprised that those are allowed on sites like ebay even.

2423. Getting the Nagoya NA-701 and NA-771 to fit correctly - one fix

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-17 17:31:51 UTC
From: Jim
Topic: 2423 Message: 2423

Anyone that has tried to mount a Nagoya NA-701 or NA-771 (tall) has probably found that they don't mate very well, if at all, with the UVD, because the outer lip is too deep. The NA-S775 looks like it will mount better as there is no lip at the connecting surface and the barrel appears to be narrower--anyone comment?

My simple fix for the 701 and the 771 is to sand down the outer lip to expose more of the SMA connector. Drill a hole in a flat board for the SMA connector to drop into (11/32 +/- is good), place a piece 80 or 100 grit of sandpaper over the hole and pop a hole into the sandpaper (or just drill through both). Place the antenna into the hole, holding it flat against the paper and rotate it back and forth to take the lip down. Rotate your hand position on the antenna every few turns as this will keep the sanding even across the surface. Once you have taken away just under enough material (check against fit--clean first--or match with the original antenna), switch to 150 grit and/or 220 (or emery or a 3m abrasive pad) to smooth the surface if you want a cleaner look. Carefully clean out the inside of the lip with a pick, small screwdriver, etc and then use air or a cloth to get the fine particles out.

I have also found that some of the antennas are out of round, so they will hit against the higher left side of the UVD chassis and not seat all the way. I help this a bit, by beveling the outside of the lip to 45 degrees with a few twists of emery cloth. Don't crank the antenna in too hard if it is hitting the frame--it will hold fine. You can check the gap with a piece of paper.

Obviously, this voids you antenna warranty.

When scoring soft material, my tubing cutters wander worse than a Boston driver talking on a cell phone and eating breakfast. I'll pick up a new mini-cutter and see how that works--good idea.

From: g8xlh
Topic: 2427 Message: 2427

Hi All,

I have just purchased Wouxon + programming lead and software.

Despite many attempts, I could not get connection to the radio to work. After about an hour of getting no-where, I decided to try a different USB driver disk, that came with other products and Bingo !! it worked first time. Both USB driver disks look the same and have same logo etc. Perhaps I had a bad disk. My disk etc. was supplied by Martin Lynch from the UK in early September. (I am not blaming the suppler, but it could be just a one-off or a bad batch).

Regards

Alan G8XLH

Alan I had a similar problem with a Wouxum programing disk, but found it was just my computer would not read it. I used my other computer and it read it fine. Some CD drives have that problem with certain disks, even new drives. Alan, I had the same type issue but the software disks I bought with the cable at a hamfest was OUT OF DATE and would not work at all !!! Went to wouxun.com and downloaded the latest there and have been ok since

I've been showing everyone from our regular radio club to our ARES club and many are going to buy a WOUXUN.. everyone seems impressed

hi my solution was to get the antenna with the bnc connector and buy a sma to bnc adaptor this also works well when connecting to an external antenna also saves mechanical wear and tear on the threads on the radio

It has been well over the month stated for the announcement of the new Wouxun mobile rig....

The FCC OET site shows no new FCC authorizations from Wouxun.... and we have heard no updates here....

What gives?

I'd imagine they would at least get the FCC approval prior to even
allowing a beta test.

I agree. The 1st couple version of the KG-UVD's had FCC approval but still needed people in the field to "test them" and Wouxun fixed it on future versions. Hence, they paid to beta test it for Wouxun.

The KG-UVD1P is intended for commercial use- it just happens to cover Ham bands and is a great hand held. I use mine for Ham repeater access and as a second radio at work. It is type approved for Part 90.

I am not an expert on this, but I think External Power Amplifiers are the only items needing Certification for Amateur use.

In the UK, we have some common sense - your can buy whatever you like
for Amateur use, it's up to the licence holder to ensure it complies
with the relevant conditions of your licence.

There is no "certification" in Part 97 for anything except amplifiers that can transmit around 10/11 meters. However, I understand anything sold here has to at least conform to part 15. Or something.

> --

You are correct on both counts. All "commercially manufactured" radios NMUST at least have Part 15 approval.

IF a radio is Type Accepted for other services, such as Part 90 as the Wouxun HTs are, then Part 95 is automatically included... thus, they can be legally sold and used in the USA.

Since the late 1980s (help me here.. a guess) An FCC ID is required for all RF devices in the USA. If your radio does not have this ID.. it is illegal. *even for amateur use* as it is "commercially manufactured"

Part 97 does NOT include ALL the regulations for the amateur service... Part 15 also applies.

If you read all of Part 95 (a Massive undertaking) You will find a lot of information you never had even considered before.

There are a LOT of hams out there who are subject to fines or worse for not operating legal equipment.

Certain amateur amplifiers need Part 97 certification. Other radios need Part 15 certification.

Check out the label of any of your amateur radio transceivers and you will see that they are type accepted under Part 15 of the FCC rules.

2446. What is the range of your KG-UVD1P?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-20 02:15:58 UTC
From: David A. Behar
Topic: 2431 Message: 2446

What is the range of your KG-UVD1P talking direct?

I connected mine to a VHF quarter-wave antenna on the roof of my car, and both yesterday and today I contacted Col. Doug Wheelock on the International Space Station. I'm not sure exactly how far away he was, but I know that the ISS is about 220 miles high and he's zooming past at about five miles per second, so I'm sure my contacts were at least several hundred miles away.

If you are outside in the clear, there is a good chance you can even contact him with the built-in antenna. Here is some more info that will help:
a.. Transmit on 144.49, and listen on 145.80 (standard "wide" deviation)
b.. Use a site like www.heavens-above.com to figure out when the ISS will be within range. On that website the "All passes of the ISS" link is what you want. Be sure to configure the website with your location!
c.. There is less pass loss when the Maximum Altitude is as high as possible -- e.g., 90 degrees would indicate that the ISS is passing directly above your location. If there is a high pass you might want to point your antenna 45 to 90 degrees away from where the ISS is, because I think a short vertical antenna does not radiate lots off the end.
d.. Check out Col. Wheelock's daily schedule at http://www.nasa.gov/mission_pages/station/timelines/index.html (then select today's schedule). Until they do a crew change in several days, he is the guy identified as "FE-4" (Flight Engineer #4). I understand that once Expedition 25 starts, he will become the commander (identified as "CDR" on the schedule). Your best bet is to look for him during the "pre-sleep" period, or the first part of the sleep period. Note that the published schedules gives times in UTC. As you will see from recent schedules, the ISS crew pretty-much keeps to a UTC-based schedule -- with sleep scheduled from 2130 - 0600 UTC. But my contact Saturday was at 2340 UTC -- more than two hours after bedtime. (You know how it is -- you want to stay up late to play with the radio!)
e.. When the ISS two-meter radio is not being used for voice contacts, the crew leaves it in packet mode on 145.825 mHz. So you can test your setup -- at least for receive -- by listening on 145.825 for packet radio sounds. And if you do hear packet sounds on a particular pass, that probably means that there will not be voice contacts.
f.. I have heard Col. Wheelock on the air from the ISS every day in the afternoons (Pacific Time) over the past five days or so, so it seems like he is quite active.
g.. You may find, as did I, that the signal from the ISS is remarkably strong and easily readable.
h.. Although you can hear the ISS, you can't hear the other people calling the ISS -- so it's not obvious when to call him. The technique I used was to just give my callsign clearly with phonetics every 5 or 10 seconds when the astronaut is not transmitting, and sometimes my location -- e.g., "KILO SEVEN DELTA BRAVO (pause) SPOKANE". Then Col. Wheelock will come back with something like "I heard K 7 Delta Bravo, W 7 XYZ, and K 6 A B C. Welcome aboard, this is N A 1 I S S on the International Space Station".
i.. QSL information is at http://www.issfanclub.com/qsl.
j.. Good luck -- let our group members know if you have been successful in contacting the International Space Station.

Why FCC? There are other countries in the world!

Seriously, UK hams, with Intermediate or Full licenses, (just as an example) would be able to conduct a beta test without any prior approvals. Do US hams have to use only FCC-approved gear?

I see you've made the common mistake - these are commercially
produced, and so Foundation licencees can use them too.

Thanks for that Gordon - I stand corrected! UK Foundation license holders
can use any commercially-made equipment or any approved kit radios.

(the rest of us can use home-brew as well)

Something I'm looking forward to having time to do - one day!

It was a common misconception that Foundation licencees had to use type approved or CE marked equipment, but that's not what the licence conditions say!

I think the key word in all this is sell to sell radios in the us you got to have the FCC sticker.

A ham with a valid ham ticket can beg barrow or acquire any thing he wants to use as a radio as long as it operates within the rules . but selling it is a total other story

It has to do with who is going to pay to fix the mess. If your receiver is built bad and radiates and interferes with your neighbors TV.With an FCC sticker who ever made it has to fix the problem and pay fines if necessary. If it does not have one You Have to fix it and you get to pay the fines . So it has to do with who pays if things don't work right.

A ham in the us can use any radio made any where by any one on the ham bands as long as it works right but he cant sell it without the FCC label .

I hope the Wouxun Mobile will show up at the HONG KONG radio show this year it is in October so that is not far off

I've done sat work too.. AO51 and AO27. I've had many contacts.

I have all the ISS stuff you provided programmed now. I use Orbitron to track sats. We will see if I can hit the ISS.

Hi All,

This is my first posting on this group, and what a goldmine of relavant information there is here. Great Stuff!

Ditto the previous message. I would also like to find more info on the announced mobile rig. I just purchased the kg-uvd1p out of Hongkong and am mostly very happy with it.

The main thing that disapoints me is that I cannot find any way of locking out one more channels that are programed to be scanned. If any of the pre programed channels goes high noise and cannot be silenced with maximum squelch, then every time you run scan it will lock onto that channel and stay there. That is annoying as short of reprograming that channel there does not appear to be any other solution.

I have explored using "Dealer Mode", but even this does not provide a solution. The only way I do it now is to switch "scan" to off on the laptop software and then "Write to radio", a rather messy way of doing it. One would think there must be a simple way.

Am hoping that maybe a more experienced user may be able to prove me wrong.

Cheers,
Bob VK4UD

Try this. In dealer mode, set menu option 13 to "on" and reprogram the memory. That should lock it out of scan when busy. I think.

Hi, I copied this from another postig here.-

Re: Dealer Mode- What is it for?

Repeat of old Dealer Mode Info--
Dealer Mode

Press 8 and then Power On
Password 268160

When you have a channel programmed, the radio will not let you change power, tone, busy lock, wide/narrow etc from the keypad. Dealer mode allows such changes.

Dealer mode Does Not allow changes when the software has programmed Menu OFF.

When you are in the open or computer and programming cable are not at hand, you can
change the high/low power, CTCSS/DCS group, busy channel lockout, wide/narrow bandwidth and parameter on every channel through the dealer operation mode.
Operation Method:
Holding on [8] key and powering on the transceiver at the same time, then inputting
password "268160", the transceiver enters dealer operation mode.
When you are changing the above parameters on channels, please firstly call out the
channel that will be changed, and set it as the master frequency through [A/B]. Then you
can change the parameters of high/low power, CTCSS/DCS group, busy channel lockout,
wide/narrow bandwidth .
SAVE & EXIT: Press [MENU]+ [A/B].

The Dealer Mode "Busy Lock" is not scan related, it prevents the radio from transmitting if the squelch is open. There is a "time delay" scan mode that will sit for about 5 seconds on the open channel before resuming the scan.

From: Bob W
Topic: 2463 Message: 2466

Thanks for that Rob,

I finally know the function of BCL. spent agen try different things to work out what is does. Squelsh open - no transmit.

Too easy but still does not solve my original problem of how to lock a channel out of the scan group. I really like to have scan set up to stay on active channel till carrier drops out, wait a few seconds and then off to scan again. It seems the only way to handle the noisey channel syndrome is to use the time squelch setting, trouble is by the time you get grab the radio and kill the scan, it has moved on and you do not know which channel opened the squelsh.

Even in dealer mode, you cannot deselect a scan channel. The only way I know to do it is using the software on the laptop and reprogamming the radio.

see that the KG-UV3D is on the fcc documents list.

link here
https://fjallfoss.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&calledFromFrame=N&application_id=877723&fcc_id=\'WVTWOUXUN04\'

look at the SAR document.
when is that version coming out or do they still need more feed back?

plus what is this new radio from wouxon that someone else mentioned?
something about a mobile unit.

When you hold the pound/lock key the radio begins scanning ...something ... starts at 00 00 and just keeps counting up probably to 99 99 . Anyone know what this is for ?

Right it sounds like the processor in the radio has gone to sleep!!dont laugh !
so install the wouxun v1.16 software on pc from the wouxun site.
then connect radio to pc via programming lead and start wouxun software, turn on radio
check correct com port,
DO NOT!!! read from radio,
write back to the radio a BLANK!!! page from the wouxun software,
turn radio off then back on you should now have a fully functioning radio, you will have to re program it again,

i was told about this by a top engineer at on of the top chinese handy manufacturers and it worked for me,

COLIN G1NX1 UK

There have been some issues with batteries... and/or chargers.... I had/have a
weird charger. The one I got with my radio from Ed works fine...
It can be hit or miss. So far my batteries have been fine, althought I was
worried once... but it came out ok

see that the KG-UV3D is on the fcc documents list.

link here

https://fjallfoss.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&calledFromFrame=N&application_id=877723&fcc_id=\'WVTWOUXUN04\'

look at the SAR document.

when is that version coming out or do they still need more feed back?

plus what is this new radio from wouxon that someone else mentioned?

something about a mobile unit.

My fairly new KG-UVD1P (about 6 weeks old) already has a dead battery. Same result as yours - charger lights up green, but battery is dead. Thankfully I bought the optional AA case, so I can still use the radio without a problem, but would like to know why a brand new battery pack was so short lived. Perhaps I cooked it leaving it in the desktop charger too long? Although I thought I read the desktop charger was 'intelligent' :-) Guess not.

I had the same problem - didn't matter if the battery was fully
charged or run down, charger showed green. It turned out to be the
charger. Ed replaced my charger under warranty and the new one works fine.

Your battery may not be defective - just not being charged.

Ok I went back into the programming and after trying several things i was able to right click on the transmit frequency listing and then I cut it and it allowed the space to be blank . I downloaded it to the radio and then went to the frequency and tried to transmit. It only beeped. No transmit. I was trying on a NOAA weather channel.

I have heard if you push it too far out of band, it can lock the radio,
rendering it useless. I am unsure of the specifics.

Thinking back... there was an issue.. Make 100% sure your battery is seated properly in the charger... some chargers had this issue... If there wasn't proper contact, the charger would give a false "charged condition"

Hey folks,
Getting in kind of late on this thread, but just joined the group for this very problem.

Have some more channels that won't program..
152.3675
157.6275
152.9525
160.0245

Used for local EMS and VFD services.

Hope they come up with a 'fix' to the software!

I don't think leaving it on the charger should be a problem in terms of "not being intelligent". I have owned my Wouxun for 6 months now, and the radio sits in the charger (mostly!) when not in use. I've even been away from home (and my radio) a couple of times for a month and left the think "charging".

Well, if I try readjusting it, the red light will come on a second and then it goes green, saying it's fully charged. If I take it out, it won't power up - ie: battery dead. But if I put it back in the charger and the green light comes on, I can turn the radio on in the charger itself and it works fine, so I'm suspecting the battery is making good contact in there at least.

I had the same problem the first time I tried to charge mine. I would put it in the charger and the red light would blink on then go off. I even left it in the charger overnight and no charge at all. After I complained to the dealer here in Texas (mtc.com), I found out it was pilot error! There are slots on each side of the battery and corresponding protusions in the charger, make sure the battery is in these. Mine works fine now that I found the slots and looked at the charger. Hope this is your problem. Have a great and blessed day,

Bill WV5TX

You might try removing the battery from the radio and put it in the charger-just to make sure it is in the charger properly. Also, if you have a meter, what is the battery voltage?

I think the mfg. are working on updating there rigs this thread has burned a lot of bandwidth in the past

you can tune those frequencies for receive by setting them as close as you can get the will work but your out of luck on transmit

example

for 152.3675 set the radio to 152.365 it should work OK on receive

Hey folks,

Getting in kind of late on this thread, but just joined the group for this very problem.

Have some more channels that won't program..

152.3675

157.6275

152.9525

160.0245

Used for local EMS and VFD services.

Hope they come up with a 'fix' to the software!

73, W5LVB

I have found it takes several attempts to get the battery in the charger correctly to charge properly. You need to align the grooves on the battery right with the charger.

Well, if I try readjusting it, the red light will come on a second and then it goes green, saying it's fully charged. If I take it out, it won't power up - ie: battery dead. But if I put it back in the charger and the green light comes on, I can turn the radio on in the charger itself and it works fine, so I'm suspecting the battery is making good contact in there at least.

Exhibits same behavior if I just put the bare battery in the charger. It's definitely sliding in on the little plastic rails, so I know it's making good contact, I can see all the contacts down in there touching, and it had worked for about the past 6 weeks :-)

If I meter the battery outside of the charger, it shows completely dead. However, if I meter it inside the charger it would appear it's reading just over 6 volts, so it would appear it's definitely the battery. Radioshop888 has offered to let me send it in to them, but given the shipping to Hong Kong would probably be the same as simply ordering a new battery, I think I'll just buy a new battery. What's the best US dealer for these? I'd rather buy my next one and/or accessories from someone in the states that is closer :-) http://www.wouxun.us/ I take it is a good choice?

While you are spending money, you might consider the higher capacity battery- 1700mah, I think.

For one last sanity test before trashing your old battery, try the
following:

a) Unplug your charger.
b) Clean the battery contacts (outside and inside of battery) with rubbing
alcohol and some cotton swabs.
c) Clean the charger contacts with rubbing alcohol and q-tips or whatever
you have that will reach.
d) Dry with paper towel and let rubbing alcohol evaporate for a few minutes
until it is completely dry
e) Plug in charger
f) Plug battery (without radio) into charger and let charge for at least an
hour while checking charging light
g) check the voltage again

This would really only help if your contacts became dirty (or greasy from
hands), but is generally a good troubleshooting step. Of course if you had
corrosion or oxidation showing on any of the contacts, then you would also
need to clean that away as well.

Good Luck.

Yeah if I order one it will likely be the 1700mah version. The US dealers seem to all have fairly high shipping rates from what I can find. $22-$24 for the battery + $10 to ship a battery. I can nearly get 2 1700mah batteries including shipping from HK at that price :-/ Anybody include shipping in their US prices?

DJ,

I think $10 is too much for shipping in the U.S.

I don't spam but since you asked, I send you the following:

My price for the 1700mAh Li-ion battery is $25 and USPS Priority Mail flat rate postage is $5.
That gives you 2-3 day shipping. First class is slightly lower but will take 3+ days depending on your location.

At the top of the unit (where the terminals are), use a quarter, a strong finger, or a flat item such as a large screwdriver and press the flat side of the battery case away from the belt clip direction. The top should easily unsnap giving you access to the batteries inside.

After several times, you will be able to do it with a finger once the little locking clips wear a bit from opening and closing.

2535. Wouxun KG-UVD1-P Display prob

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-09-29 11:49:56 UTC
From: sprakashb
Topic: 2535 Message: 2535

Hi all

My unit had a display problem after a few days. I contacted the Wouxun people and they advised to check the cable between Display and main board. We found that the thin flat cable was broken and we tried to locate one of similar type. I could find one with 24 pins whereas the original one had only 20 pins. The extra 4 pins were cut carefully at both the ends and the cable was replaced. The display was back to normal.

I guess if you can fix it yourself it might be easier since you have to pay to ship it out and then wait who knows how long to get it back . Good thing it was 'easy' . Since it's a low cost radio I probably would have attemted to fix it myself as well. I'll have to remember this fix , just in case . Thanks .

Yes it was and still is under warranty. But as costs of shipping would have been quite a bit we first tried it as per the instructions received from Wouxun.

This has been discussed in detail, but I think the bottom line is that you are out of luck. You need a Step of 2.5 to get these frequencies.

Sometimes there simply isn't anything to share with you. This is the case presently, however, there is an upcoming electronics fair called "Autumn Edition" happening in Hong Kong at the Hong Kong Convention and Exhibition Center on October 13-16 and Wouxun Electronics will be there in booth 3C-C21 if you would like to have a preview of new products personally.

Your other option is to let your Wouxun dealers provide you with the information as we obtain it outselves. Wouxun is closed-mouthed about their products until they hit the market and they don't hit the market until they are shown at the trade show.

Hello Ed #2 AKA crest25

are you going to the show this year ? looks Like Serval Companys are going to have new inproved rigs there this year.

Sometimes there simply isn't anything to share with you. This is the case presently, however, there is an upcoming electronics fair called "Autumn Edition" happening in Hong Kong at the Hong Kong Convention and Exhibition Center on October 13-16 and Wouxun Electronics will be there in booth 3C-C21 if you would like to have a preview of new products personally.

Your other option is to let your Wouxun dealers provide you with the information as we obtain it outselves. Wouxun is closed-mouthed about their products until they hit the market and they don't hit the market until they are shown at the trade show.

Dan,

Not going to make that one. I'll wait til Vegas but I'm on the release line for when the products are available. Meanwhile, we just can't find a better model than we presently have with the UVD1P.

Yes they tell me they have three new models.
1 - KG-UV920R dual band mobile
2 - KG-UVA1 dual band HT with no display
3 - KG-869 they describe as "with 6 keypads only". Maybe it's hexagon shaped ;-)

I'll post some pictures of the new stuff and if the new mobile is not bolted down.....

But keep in mind guys, this thing may be some time away from production, Certification and such. But I'll let you know how how my beta model works!

Ooh! A model with no display? That will either mean totally stripped down with no features, or totally eyes-free accessible. (My money is on the former, though I am hopeful for the latter.) Of course, definitely interested in developments on the KG-920R. Need a extra beta tester? I'm your guy :)

Maybe "6 keys only" Make it simpler for the commercial crowd?

Thanks for the info :)

FCC certification takes a while.. tooling production facilities takes a while.. building inventory takes a while... Understood...

We, at least, have some word... patience is needed now. Let the process WORK.

wouxun hasn't let us down.. let us not let THEM down.. They have a vision to keep us in good equipment at an excellent price and quality.... our support (and buying radios) has motivated them to listen to us, and take our ideas seriously :)

What other manufacturer has the loyalty we give Wouxun?

John KD8DVR

Getting the FCC part 90 perhaps... Computer programmable only?? don't get folks pushing buttons and getting confused. Would be nice for MURS, where you give thw wife and kiddies a radio that is simply push to talk :)

I hope they don't shut down the UVD1P - in 5 or 6 weeks I'm hoping the XYL will have her Foundation license and I don't want to buy her a rig that's different to my own (2 sets of different Tech Support for me to do!)

There's nothing I want, and very little even that I'd like, that's not in the existing model!

But maybe there'd be a lot of "used" UVD1P models on eBay from hams who have rushed to upgrade? I doubt it.

Stu, G3OCR

Yes they tell me they have three new models.
1 - KG-UV920R dual band mobile
2 - KG-UVA1 dual band HT with no display
3 - KG-869 they describe as "with 6 keypads only". Maybe it's hexagon shaped ;-)

I'll post some pictures of the new stuff and if the new mobile is not bolted down.....

But keep in mind guys, this thing may be some time away from production, Certification and such. But I'll let you know how how my beta model works!

2564. Question about 'unlock' software

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-02 19:28:25 UTC
From: Geert Jan de Groot
Topic: 2564 Message: 2564

I'd like to "re-lock" a currently "unlocked" radio.
I cannot find a way to select the COM-port the software uses.
When I use a USB-serial dongle, I can find the COM-port it uses,
but how do I tell the software?

Geert Jan

Bring up regular software first set up for download when it is talking to the radio open the unlock program should work then

On my computer, the Unlock software seems to find the Com Port with a radio connected-automatically or magic but it works.

What does the unlock software allow, that the programming softare doesn't?

I am yet to get one of these radios, but still intend to.

The unlock software allows you to operate outside of the frequency range specified for the particular radio. There are limits to how far the radio can operate beyond the design parameters. The unlock software allows the radio to accept a frequency, but does not assure that the radio can actually function at that frequency.

2569. Wouxun KG-UVD1P - what good buy!

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-03 14:15:32 UTC
From: Brian
Topic: 2569 Message: 2569

I've just bought one of these Wouxuns for my XYL (aka "senior management") and we are delighted with it.

I was concerned that the "wide band tx" would be an issue ("finger trouble" on a handheld) but the "open up" software will also "close down", so the radio is now tx only in the amateur bands.

One question, I can't see how to force the radio to stay in one band (the TDR key places in one band mode but this is over-ridden by cycling the power).

I can't see an option in the programming software nor the "Menu".

Brian,

You cannot lock the radio into one single band upon powering up. You will always have to TDR the radio for single band. I guess if you want that you can just consider you need two functions for powering up your own radio - one turns a knob and the other presses a key labeled TDR. I think we can all live with this since after all, it IS a Dual Band radio.

From: Bob Javits
Topic: 261 Message: 2571

I'm having trouble with the software on page 2 where you can select certain operating options. I cannot seem to change the frequencies at the top... that is, when I try to change VFO A to Vhf and VFO B to UHF, they keep re-setting the other way.

Is this because I do not have a radio attached?? I am trying to set up my band plan before getting the radio so I can download and operate immediately.

Thanks..

For some reason they make A the UHF and B the VHF. It doesn't seem to matter because all programmed channels appear on both A and B. I put all my VHF in low channel numbers and UHF in a group of high channel numbers just to help keep them logically ordered. All of the VHF and UHF channels show on both A and B.

Once you set them where you want them then save them to the file you are going to save the rest of the programming for the one your working on. Other wise if you don't once you leave that page it defaults back to the original configuration.

Hi raccoon_kc

What number do you have the squelch set at. I think the factory is 4.
I have changed all channels to # 9. The squelch opens at .2 uv.
No audio pop through.

In the Nov. 2010 review in QST magazine, the technician measured the maximum squelch threshold on the tested radio at 0.20 uv. Minimum squelch threshold was 0.05 uv.

2578. Optimum Band Spread

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-04 10:47:13 UTC
From: Rob
Topic: 2578 Message: 2578

I am intending to get one of these radios shortly.
Being in Australia, I want to get one that covers the 70cm Amateur Band, and the UHF citizen band.

These cover:
420-430MHz - Amaeuer 70cm (not main requirement as not most used area, but still need coverage.
430-450MHz - Amateur 70cm (main requirement).
476.4250 - 477.4125MHz - UHF CB (main requirement).

The reason for asking is the KG-UVD1P has two versions that should be okay.
400-480 & 420-520MHz

Could anyone recommend the better option based on the frequencies I require, as both are near the ends of required spectrum.
I could probably have more activity in the 400-420Mhz area when used as a receiver only, but would there be any other issues?

Either will do Rob, all the more so since the unlocking software can
open either one. Your specified requirements fall within the
420-477.4125 spread, which both do, so just go for best price.

Date: 2010-10-04 11:51:06 UTC
From: Stu Nutt
Topic: 2578 Message: 2580

I've just fired up my UVD across the band available (mine is the 400 to 479.9875 version) through a (cheap) power meter into a dummy load, and it delivers almost the same output from one end to the other, maybe 10% lower at the 420 end or it may - probably - be my cheap meter reading lower at lower frequency!

I can't say for the 420 to 520 rig, but it sure looks as if the "400-480" Meg rig will do just fine for you.

I would suspect that the two versions are very similar, but with a bit of difference in the tuning of the RF stages and different "software limits" to align it with the tuning.

If you make the A & B channels the same then engage the lock and power the radio down, when turned back on it should come up locked on one channel (both A & B).

I do this when a non ham has one of my radios, so it stays on the selected Family channel.

I believe you have to have the lock function in the programming software checked

I really like this little gem a lot! Getting ready to give it a good test on an event deployment with the local ARES group for the Memory Walk in a couple of weeks, so I should have a good feel for how the battery life is, etc. I do get good reports on the TX audio, and I really like all the features, especially for the money! One problem I see...once the QST review goes out, I can see the possibility of availability shortages, as well as the price may start inching up as demand increases. Glad I got mine before the review!

476.4250 - 477.4125MHz - UHF CB (main requirement).

The reason for asking is the KG-UVD1P has two versions that should be okay.
400-480 & 420-520MHz

Could anyone recommend the better option based on the frequencies I require, as both are near the ends of required spectrum.
I could probably have more activity in the 400-420Mhz area when used as a receiver only, but would there be any other issues?

Yes, I was thinking there was more on the 400-420MHz than 480-520MHz in Australia.

I am probably going to go through Radioshop888.com
Would there be any suggestions for a speaker mic?
I probably need one as I intend to use it a mobile setup for work.
Any suggestions for antennas from the same site?

These accessories probably don't matter too much as you don't save anything in postage combining an order as postage is factored in each item.

I am signed up on the Aurfscan site, and find it a good resource, but I'm not a full member.

Thanks Rob.

I use a speaker mike and just got one from 888 no idea of a type or model number just got one to fit.

I use the Ut 108 on mine in the truck and can not recommend any better.

As to the fixed postage price to ask for discount via email if your buying a few items in the one order as they often will do a little better to Ausssie land than the ship to us prices - but that may also be because we order stuff from them every month as well

Dave

I bought a yellow speaker-mike on eBay (can't remember the seller but the colour makes it stand out well!). Main reason for that was the good pricing and my use of it while wearing a hi-viz waistcoat with "RAYNET" in reflective on it.

I received reports of poor/low audio with that mike but when I disassembled it I found that the mike insert did not align with the very small hole in the front of the mike. I drilled 5 more holes in the plastic, about 3mm diameter, and now the audio is great.

Stu

Looks nice, Only thing I see that will be an issue which we are having with the UVD1P's as well is still no 2.5Khz step so some of the newer frequencies in the band will be unable to be programmed.

splinter frequency capable
removable control head
? Individual band lock
Short wave reception, but probably not SSB
? Selective call, DTMF, 2/6 tone, digital?

good at -20c, we will see how well that works in winter in Alberta

It would be nice to have early access to the software in order to program in all 999+ channels, I should be done with figuring out what to put where by the time the radio hits my mailbox.

in a word SWEET!

Certainly looks a very interesting rig. I'm looking forward to seeing full specs and our group's reports.

I've uploaded a picture of the new mobile radio. I'm told I can maybe get my hands on one by the end of November and production will start the first of the year. I have no idea of a price yet.

defiantly a nice rig but yes it still needs the 2.5mhz spacing.

does it really receive 50khz to 30mhz?

it says am but the transmit receive chart is confusing

WOW WEEEEEE, that's what I have to say about the new Mobile Rig comming soon!!!

I think that the BIG BOYS should start shaking in their boots, cause here comes a REAL new contender to come onto the market to shake things up a bit, finaly a chinese brand radio company putting out some decent radio gear, not like they where, say 4-5 years ago, when most of the radio's where, shall I say Toy rubbish???

Hey Wouxun, forget about making the new rig 2/4/70cm with HF AM recive only, why not just go the whole hog and make it a TRUE all rounder with full HF, TX all modes & all the way upto 23cm ham bands? or more. aww shucks chuck in digital modes too, couldn't be too much to ask for? - HI HI

real compitition for the kenwood 2000 and icom 7000/706 etc...

well done Wouxun!!!!

Date: 2010-10-06 22:18:46 UTC
From: wpascanner
Topic: 2622 Message: 2622

In looking through the archives I keep seeing threads about this 2.5MHz spread... am I understanding this that the radio will do the +- 600Khz spacing for 144MHz but can NOT do any thing less than 2.5MHz spread outside the 144MHz amateur band?

Example:

153.845 TX 155.925 RX is a NO JOY?

158.730 TX 155.250 RX is OK?

I understand there is an issue with the new splinter channels...

And this still applies to the new dual band mobile I ->was<- drooling over? ?

I am very interested in these units... so if there is a thread that explains the issue please point me to it. As this has probably saved me a lot of money if this the case and I may as well by

Thanks.

It's 2.5 KHz and that is an issue for the new narrowband rules in the US and the new splinter channels it created. Certain frequencies cannot be programmed in to the radio due to them being odd multiples of the current PLL circuit. If you do not plan on using it for commercial frequencies on these odd splinter channels in the VHF band this will not be an issue for you.

As for the TX/RX frequencies - on 70cms in UK we have some repeaters with 8MHz TX/RX spacing, and that certainly works OK

only thing that was 2.5mhz that we where talking about is frequency step we where saying how we want the step size to go to 2.5 mhz minimun instead of the 5mhz step size limitation we have now.

as in the other thing the band width is like this
narrow is 12.5 khz with deviation being 2.5khz and
wide is 25 khz with deviation being 5khz
otherwise i dont know where you got 2.5mhz

Hi

Generally you need to be in VFO mode to programme the frequencies, ctcss, repeater ,shifts etc before you put them into memory . normally you cant just add these things later to the memory they have to be done at set up of each memory/ frequency

With the price of a UVD1P at only USD$100, it would be
odd that for a few dollars more a whole 50w dual bander
would be sold.

If that were the case, I think we'd all be pleased but in a commercial
sense it doesn't ring right.

Just my opinion folks.

Brian,

Let's get practical for a minute. While the Wouxun HT is a great price, it doesn't mean a similar price structure will be available with the pending mobile. The anticipated mobile is very much like the Yaesu FT8800R. Have you priced that model lately. Do a couple of google searches for prices and you will see it probably doesn't dip into the 300s at all. I think the lowest I've seen is $419. Of course much of that pricing is the name. Yaesu has been around for decades and has a good reputation. That's what you are paying for. I anticipate Wouxun will one day have that same enjoyed reputation but it takes time to develop.

Would you buy the Yaesu for $350? Of course - assuming you had $350. Would you buy the Wouxun for $350? Perhaps not but if you realized it does the same function and performance as the Yaesu then perhaps you would pay $350 for it since it accomplishes the same needs for you.

Wouxun contacted me for advice and input into pricing, market, accessories, functionality, etc. which I gave them readily after doing some research first. The mobile is due to make its appearance shortly and availability of the radio probably will be right after the new year. They don't have a price on it yet (the reason they asked me for data). I'm not at liberty to divulge my findings but I can tell you my recommendation is not below $200. Still, I agree with the subject line - "look out big boys, Wouxun is coming through."

With the price of a UVD1P at only USD$100, it would be
odd that for a few dollars more a whole 50w dual bander
would be sold.

If that were the case, I think we'd all be pleased but in a commercial
sense it doesn't ring right.

Just my opinion folks.

Well I'm with you on that one ED the alinco mobile radio is the cheapest dual band mobile I have found out there with a +/- of about$50 so yes it is about the name for the most part but if wouxun can put out a mobile that will do the same as the big boys Co. For a lower price I'm sure the wouxun is going to go nuts sales wise this just my saying and I'm stick in to it

How many dual-band HTs are even available brand new for under $200? From what I've seen lately it seems like $300 is even iffy, especially something hot off the presses, as it were. Speaking strictly for myself, if Wouxun is asking a big name price for the mobile and the economics aren't as favorable as they are for the HT, my interest will be pretty much shot. Just my opinion.

I have both the KG-UVD1P AND THE KG-669 the programing on the radios are not the same I want to add my favorite fm radio stations into the 669 but can't figure out how to do it I am in a wheelchair and take the radio with me when I'm out gardening . I have figured it out on the KG-UVD1P it's straight forward

I'll have to agree here. I've been showing off my Wouxun HT to everyone I know for the past month and although I've gotten interest from two who have each purchased a radio most of the comments run along the line of "Who is that?" and "I won't buy a radio from a manufacturer I don't know". The QST review will raise the brand recognition a bit but to most of the Amateurs out there see Wouxun as an unproven Chinese manufacturer. I can justify $200 or so for a mobile from Wouxun but I don't think I can justify much more.

If the Wouxun is usable by a blind ham, with voice output such as the HT has (or better would be, well, better), I'd buy one. Even at $300 or whatever. Seriouly guys, full dualband, true dual receive, and crossband repeat, and you want it under $200? If you really think this will happen, you are (pardon me) delusional. Now if we were talking about something with only dual watch such as the HT has, and no crossband repeat, and half the memories, and no shortwave receive coverage, I might agree, but y'all are asking an awful lot here. If I could get radio like the KG-920R that is accessible and usable to me as a blind ham (which many of the Yaesus aren't so much, Kenwood probably has the best track record here), at $300 to $350, I'd call it a good deal and tell my friends. If it's less, I won't complain, but really guys, be reasonable.

Just one man's opinion...

Well, the HT doesn't have all the features (true dual band receive, for instance) that the big boys have, but it's 1/3 the cost.

The mobile looks like it'll have nearly all the major features the big boys have, so I'd expect it to be around 1/2 the cost, due primarily to the brand recognition problem, and them being considered a newcomer to the market. The HF receive is particularly nice, though, and I'd be willing to pay more if reviews show that it works well.

So I'm looking for it at $220 or so. If they can make that price point, I expect to be first to the wouxun.us booth at the dayton hamvention to fiddle with it, if I haven't already been convinced by reviews prior and ordered it online.

Lets see... VX-7r go for around $279. A plain Jane dual band HT is in the $250-300 range. We are not talking about IC-92s or VX-8DRs here. So, a Wouxun UVD1P dual(sorta) band HT for $105-$130 is a great deal.. that's why they are selling so well. This is less than 1/2 of a "brand name".

A KENWOOD V71 at Dayton last year was $349. Again, not a ICOM 2820 or D710 or a YAESU high power triband mobile, but a nice true dual band mobile. A Wouxun mobile at the $300 price point might not be a big seller. At $200 it would be a good deal, but not 1/2 of a "band name".

But, hey, that's what competition is all about. I have not checked JETSTREAM prices lately..

"They don't have a price on it yet.." A fair price should be based on the cost of production, delivery, support, and a reasonable profit against competition. If Wouxun can't figure that out on their own.... looks like it might not be a "fair" price.

Kent

With the price of a UVD1P at only USD$100, it would be
odd that for a few dollars more a whole 50w dual bander
would be sold.

If that were the case, I think we'd all be pleased but in a commercial
sense it doesn't ring right.

Just my opinion folks.

Kent,

You stated "A fair price should be based on the cost of production, delivery, support, and a reasonable profit against competition." While that sounds like good reasoning, that's not how a market place operates. That establishes the minimum price. The actual price will be whatever the buyers will bear.

I am familiar with a certain product that can be produced for about $50 yet sells retail for over $200. Many retail markups are 100% of wholesale so in theory this item should sell for about $100 but it has a patent to protect it from scammers and there is only one company to get it from and that price is well over $200 each.

I imagine the mobile could probably be produced (in China) for in the neighborhood of $25-$50 in mass production. I think Wouxun is quite smart in their marketing in that they already let the secret out and established a lot of hoop-a-la discussion about the anticipated mobile. It's already the talk of the town so don't be surprised if this talk runs the price up even more.

We all want the best deal we can find for the best quality product. That's understandable. I want that too as a consumer. However, I also want it as a distributor of the product in that 1) the lower the price the easier it is to sell and 2) so long as the quality is there, it probably doesn't really matter what the price is so long as it is reasonable. If it's good quality, people will purchase it.

I already market a very good mobile for $350 that has an MSRP of $400. It has enhancements that the Wouxon does not but is a single band radio - either UHF or VHF. If Wouxun produces this mobile with the same quality and enhancements, then there is no reason it couldn't be marketed for $350, down from the MSRP of $400. It will still be under the Yaesu FT8800R prices by $50.

Lets see... VX-7r go for around $279. A plain Jane dual band HT is in the $250-300 range. We are not talking about IC-92s or VX-8DRs here. So, a Wouxun UVD1P dual(sorta) band HT for $105-$130 is a great deal.. that's why they are selling so well. This is less than 1/2 of a "brand name".

A KENWOOD V71 at Dayton last year was $349. Again, not a ICOM 2820 or D710 or a YAESU high power triband mobile, but a nice true dual band mobile. A Wouxun mobile at the $300 price point might not be a big seller. At $200 it would be a good deal, but not 1/2 of a "band name".

But, hey, that's what competition is all about. I have not checked JETSTREAM prices lately..

"They don't have a price on it yet.." A fair price should be based on the cost of production, delivery, support, and a reasonable profit against competition. If Wouxun can't figure that out on their own.... looks like it might not be a "fair" price.

Brian,

Let's get practical for a minute. While the Wouxun HT is a great price, it doesn't mean a similar price structure will be available with the pending mobile. The anticipated mobile is very much like the Yaesu FT8800R. Have you priced that model lately. Do a couple of google searches for prices and you will see it probably doesn't dip into the 300s at all. I think the lowest I've seen is $419. Of course much of that pricing is the name. Yaesu has been around for decades and has a good reputation. That's what you are paying for. I anticipate Wouxun will one day have that same enjoyed reputation but it takes time to develop.

Would you buy the Yaesu for $350? Of course - assuming you had $350. Would you buy the Wouxun for $350? Perhaps not but if you realized it does the same function and performance as the Yaesu then perhaps you would pay $350 for it since it accomplishes the same needs for you.

Wouxun contacted me for advice and input into pricing, market, accessories, functionality, etc. which I gave them readily after doing some research first. The mobile is due to make its appearance shortly and availability of the radio probably will be right after the new year. They don't have a price on it yet (the reason they asked me for data). I'm not at liberty to divulge my findings but I can tell you my recommendation is not below $200. Still, I agree with the subject line - "look out big boys, Wouxun is coming through."

The question, then, is whether they are going to market it directly against their competitors ($50 below the market leader for a $400 price point is only a 13% savings), or whether they are going to shoot for the underserved market below the leaders.

There is nothing in this niche at the $200 price point. If they hit that price point, they will fairly well sell many more than they would at a $350 price point, which is akin to a coupon discount, or trade-in discount.

If the difference between the name brand and the qouxun is only 12% of the total unit cost, a lot of people who are at the price point will simply go with the brand leader.

I don't know what the demand curve is (and I bet no one really does) but they (and their distributors) may make more profit at $200 than they would at $350 due to volume.

However, there's a small kink in this anyway: The biggest market for these radios is the public service/private business sector. Once the radio is evaluated, they may prefer a $350 price point, because they will wonder what's wrong with it if it costs 1/2 the cost of their normal radios. But they will order it over the name brand even at only a 12% savings because it adds up over a few hundred radios.

I certainly don't know enough about the market to hazard a guess. I'm merely hoping that it's low enough that I can afford one...

Wonder how quickly they can get it to market - if this item can be available for sale in January next year they would make a small fortune off us aussies who use commercial radios on our
UHF CB radio freqs as our UHF CB is under going a change and many older radios need to be replaced.

I myself need 3 radio to replace my aging philips/simco units that have UHF CB and Company freq in as they can not meet the new channel spacing and band width required.

Earlier this year we replaced all out old Motorola Hand held's with the Wouxun KG-UVD1s at a aussie price of around $120 each compared to the Motorola's at $800 each, and the little Wouxun's are easer to program, work just as well and well like by all users.

So if they are going to be out there before 1/1/2011, I want.

Other wise we are going to import these units
http://www.survival-systems.com/yeticom/AT588UHF.html which would be about $290 our money.

I would not speculate. The radio looks like it has a detachable faceplate and all the bells and whistles modern mobiles have.

Don't expect a "bargain".

I will be very surprised if it is below $300.

Wouxun is starting to become a "player" now.... I expect the 2011 product line to be more expensive.

We can wish.. but let's look at reality.

At the same time, I was surprised to find a dual band HT for $100. If its over $250, I'll be surprised.

Thanks,

I would not speculate. The radio looks like it has a detachable faceplate and all the bells and whistles modern mobiles have.

Don't expect a "bargain".

I will be very surprised if it is below $300.

Wouxun is starting to become a "player" now.... I expect the 2011 product line to be more expensive.

We can wish.. but let's look at reality.

No, no, don't misunderstand me. The Yaesu is WELL worth more than $50 anyday. I'm saying if the Wouxon mobile is basically equal to the Yaesu and yet Wouxun prices the radio $50 less than the favorite Yaesu, then I believe that $50 difference will be a big swaying factor for many prospective customers. Both radios have to be equal in quality and features in this example. I'm thinking they won't be.

Kent,

You stated "A fair price should be based on the cost of production, delivery, support, and a reasonable profit against competition." While that sounds like good reasoning, that's not how a market place operates. That establishes the minimum price. The actual price will be whatever the buyers will bear.

I am familiar with a certain product that can be produced for about $50 yet sells retail for over $200. Many retail markups are 100% of wholesale so in theory this item should sell for about $100 but it has a patent to protect it from scammers and there is only one company to get it from and that price is well over $200 each.

I imagine the mobile could probably be produced (in China) for in the neighborhood of $25-$50 in mass production. I think Wouxun is quite smart in their marketing in that they already let the secret out and established a lot of hoop-a-la discussion about the anticipated mobile. It's already the talk of the town so don't be surprised if this talk runs the price up even more.

We all want the best deal we can find for the best quality product. That's understandable. I want that too as a consumer. However, I also want it as a distributor of the product in that 1) the lower the price the easier it is to sell and 2) so long as the quality is there, it probably doesn't really matter what the price is so long as it is reasonable. If it's good quality, people will purchase it.

I already market a very good mobile for $350 that has an MSRP of $400. It has enhancements that the Wouxon does not but is a single band radio - either UHF or VHF. If Wouxun produces this mobile with the same quality and enhancements, then there is no reason it couldn't be marketed for $350, down from the MSRP of $400. It will still be under the Yaesu FT8800R prices by $50.

Lets see... VX-7r go for around $279. A plain Jane dual band HT is in the $250-300 range. We are not talking about IC-92s or VX-8DRs here. So, a Wouxun UVD1P dual(sorta) band HT for $105-$130 is a great deal.. that's why they are selling so well. This is less than 1/2 of a "brand name".

A KENWOOD V71 at Dayton last year was $349. Again, not a ICOM 2820 or D710 or a YAESU high power triband mobile, but a nice true dual band mobile. A Wouxun mobile at the $300 price point might not be a big seller. At $200 it would be a good deal, but not 1/2 of a "band name".

But, hey, that's what competition is all about. I have not checked JETSTREAM prices lately..

"They don't have a price on it yet.." A fair price should be based on the cost of production, delivery, support, and a reasonable profit against competition. If Wouxun can't figure that out on their own.... looks like it might not be a "fair" price.

Brian,

Let's get practical for a minute. While the Wouxun HT is a great price, it doesn't mean a similar price structure will be available with the pending mobile. The anticipated mobile is very much like the Yaesu FT8800R. Have you priced that model lately. Do a couple of google searches for prices and you will see it probably doesn't dip into the 300s at all. I

think the lowest I've seen is $419. Of course much of that pricing is the name. Yaesu has been around for decades and has a good reputation. That's what you are paying for. I anticipate Wouxun will one day have that same enjoyed reputation but it takes time to develop.

Would you buy the Yaesu for $350? Of course - assuming you had $350. Would you buy the Wouxun for $350? Perhaps not but if you realized it does the same function and performance as the Yaesu then perhaps you would pay $350 for it since it accomplishes the same needs for you.

Wouxun contacted me for advice and input into pricing, market, accessories, functionality, etc. which I gave them readily after doing some research first. The mobile is due to make its appearance shortly and availability of the radio probably will be right after the new year. They don't have a price on it yet (the reason they asked me for data). I'm not at liberty to divulge my findings but I can tell you my recommendation is not below $200. Still, I agree with the subject line - "look out big boys, Wouxun is coming through."

With the price of a UVD1P at only USD$100, it would be
odd that for a few dollars more a whole 50w dual bander
would be sold.

If that were the case, I think we'd all be pleased but in a commercial
sense it doesn't ring right.

Just my opinion folks.

One could conjecture that the US dealer retail price of $105-130 for the HT is due to the "internet" ebay Hong Cong price of around $100.

If the ebay Hong Cong price for this forthcoming mobile is below $200... then, buy from them.

I'd rather buy from a US dealer... but this is a world economy.

Yes, the faceplate ("head") is removable utilizing a separation kit or it can be straight (like a CB radio) or it can be tilted (like a Bearcat scanner) for ease in viewing when placed low.

I think the 218-280mhz option sounds pretty interesting. 2m/222 would probably sell since there's a definite lack of 220 mobiles on the market. At least brand new ones. I can think of just one model each from Alinco and Jetstream.

I don't know how well these will do with the older crowd, I mean that in operators that have been active longer too. A sizeable portion of the locals swear by Kenwoods and calls even Yeasu radios "yay-hoo"s. Then again, they mostly stay away from VHF/UHF.

i have an ft-8800 in my car and an ftm-350r in my truck. i am interested in the wouxon mobile but only in the 250-275 price range max. I can call yaesu and get the rig fixed within a week domestically and have easy access to tech support through vendors as well as yaesu domestically. That will be virtually non existent with the wouxon.

it's worth an extra 200.00 to me to have that. due to lack of domestic support i honestly consider my udv1p disposable. it won't be worth the effort to get it fixed if it dies. <not that i expect it to>.

wouxon has a way to go before they can compete on price point with the big guys. they are currently putting out a few decent, but lets face it, cheap handhelds. they are worth the cost but far below the quality build of yaesu's and the others. jmho

these ht's are a GREAT buy at 100.00, not so much at the 250+ an ft-60 would cost you.

Everyone may also want to consider that the Wouxun products so far, have only a 90 day warranty as opposed to others that offer a year or more.

Hi all.. .just got my HT and got it programmed by booting into
Windows... something I haven't done in about 6 months.

I've been running Linux as an operating system, and I managed to get the
Wouxun software running using WINE, but I could not get the USB cable to
work.

Has anybody been successful in using Linux to program the HT?? Hints and
tips appreciated.

Thanks and 73

The warranty statement in my package (from wouxun.us) states 18 month warranty on radio and 6 month on accessories. Any repairs must be done by the selling dealer or you pay.

2. Apparently Yes - One of the commercial manufacturers calls it "PL"

1. It's not you - the manual is awful! But one of our members (Buddy?) has loaded an "English" manual in the files section.

1. I am new to vhf/uhf/repeater protocols. I bought the kg-uvd1 and am struggling with understanding the manual. Other than recalling fm broadcast band stations, is this rig capable of recalling other data? I thought I properly placed repeater frequencies,ctss tones info in memory, but I couldn't recall it.

2. Are CTSS and pl tones synonymous terms?

Probably not worth guessing, but a price tag of $199 would not be a big surprise when you think that the mobile rig could basically be very similar hardware to the UVD1P but with an extra output stage for the higher power. (I'm not saying that it is of course)

With the price of a UVD1P at only USD$100, it would be
odd that for a few dollars more a whole 50w dual bander
would be sold.

If that were the case, I think we'd all be pleased but in a commercial
sense it doesn't ring right.

Just my opinion folks.

2661. Re: Linux for programming

Yahoo group: Wouxun_Radios (2009 — 2010)

From: skompier
Topic: 2657 Message: 2661

This is from a previous post and worked perfectly for me using Ubuntu 10.04.

Here comes a short tutorial on how to get the wouxun programming and unlock software to run under linux. For this example I used ubuntu but it should work on any other modern linux version. I also think it should work under Mac OSX but I haven't tested it as I do not own a Mac.

Concerning the programming cable under linux, things are much easier than for windows. No headache with drivers, the USB cable is regonized directly, just plug it in. The type the command: dmesg and you should see something that looks like this and shows that the cable has been properly detected:

```
pl2303 ttyUSB0: pl2303 converter now disconnected from ttyUSB0
pl2303 6-2:1.0: device disconnected
usb 6-2: new full speed USB device using uhci_hcd and address 3
usb 6-2: configuration #1 chosen from 1 choice
pl2303 6-2:1.0: pl2303 converter detected
usb 6-2: pl2303 converter now attached to ttyUSB0
```

The DB9 cable also works without problem but you don't get any output in dmesg when you plug it in.
The important information in the kernel messages is the device name "ttyUSBS0" which indicate the port the cable is using (this could be different on a different machine, like ttyUSBS1). We will use that later...

The wouxun software is a windows binary, so we need to install wine in order to run it. Type the following command or install the package through synaptic:

```
sudo aptitude install wine cabextract
```

By default the wine package is missing a dll (mfc42.dll) required by the wouxun software so we will need to add it. Run the following command:

```
wget http://www.kegel.com/wine/winetricks
```

and then:

```
/bin/bash winetricks mfc42
```

Finally we need to tell wine where to find the COM1 port (remember the device name you got when you plugged the cable in?). This is done by running the following command:

```
ln -s /dev/ttyUSB0 ~/.wine/dosdevices/com1
```

That's it, it's now possible to start the programs by copying it in the directory of your choice and running the command:

wine "KG-UVD1P 2010-05-31.exe"

wine "KG-UVD1-unlock.exe"

To make it easier to launch the program for a daily use, first make sure the exe file is executable:

chmod +x "KG-UVD1P 2010-05-31.exe"

Then it's possible to start it just by clicking on it from nautilus and choosing "open with wine program loader".
That's it, no need to use a windows computer to program or unlock the radio!
Enjoy!

Subject: [Wouxun_KG-UVD1] Re: "2.5mhz" spread/spacing issue

only thing that was 2.5mhz that we where talking about is frequency step we where saying how we want the step size to go to 2.5 mhz minimun instead of the 5mhz step size limitation we have now.

as in the other thing the band width is like this
narrow is 12.5 khz with deviation being 2.5khz and
wide is 25 khz with deviation being 5khz
otherwise i dont know where you got 2.5mhz

Stu, As you rightly said it is not worth guessing the price for UV920R
But in my opinion paying for unbranded like Wouxun (though i have 2 nos of KG-UVD1P HT) in the range of say $250-$300 for Mobile i would rather go in for branded Radio like ICOM, Yaesu and Kenwood etc.,by just paying another $50-$100 and own a good quality and hopely will have more features than what wouxun offers.

The only thing I am now starting to worry about, is that IF there is too much hype. and presure on wouxun from the consumer demand, then they my rush things a little too much, perhaps cut corners, etc.

I am currently a Quality Audit inspector for a Major car manufacturer here in Aus. (16 years on the job) expereanced in the setup of new model (Car) runs, my experiance has taught me that if they don't get tooled up right first time (or close to it) quality issues will arrise, or worst still DON'T get picked up production lag, rework, stoppage's will cause big problems, (Price increases) obviously if prices go too high, then all the antisipation will go out the window, after all, who's really going to buy it if it's the same price as the Big Boys??

So please please wouxun DON'T RUSH!!! get it right 1st time Please...

yours in waiting-
for my New, reasonable quality, great feature, semi-cheap chinese brand mobile dualband hamburger with almost the lot HI HI...

Jason

Couldn't agree more with your statement Jason, but sometimes the buying public can't see past the $$ they will they perceive they are saving & buy the cheapest product then later on they belly ache about how much of cheap heap of rubbish they bought...

I too work in the motor trade (service/warranty & now IT area) in a multi franchise dealership which had at one stage the Daewoo franchise, need I saw anymore LOL

I currently own a KG-UVD1P, a Puxing 888 uhf a Yaesu FT8800 a Yaesu Ft470 & they all have their strong & weak points, but I would have to say the Wouxun is my number one day to day radio, however if they bought out the mobile at a reasonable price I would be sorely tempted....

That's my issue as well. All I can tell you is what I'm willing to pay for it - which is not $350. Much more than $200-250, and I will purchase a second FT-8800 instead due to the fact I already have programming cables, great software, etc. for my other one. Wouxun HTs sell well because they are a good deal for a functional radio for the price, but they certainly lack some of the bells and whistles that a similar Yaesu or Icom offers as well as the name recognition. If they believe they can get nearly the price of a Yaesu or Icom product, I think they'll be disappointed. My $0.02.

I have owned 2 KYD TK-338 Both rubbish, broke after 3 months, I also had a KYD TK-760A, A bit better then the 338, but still rubbish and broke after 3 months too (Repaired numerious times). Next was/is a NEE-768 this one lasted about 6 months, broke, fixed, broke, fix about 6-7 times, it has since been semi-retired. my last repair job has stuck, but it doesn't get much use anymore, but it does still work. Now I have my Wouxun, almost 12 months now, with no major issues with the radio itself, I have had to replace the original antenna (broken) and have had to repair the Speaker mic (Internal broken wire near plug). other than that, my experiance with Wouxun has been very happy.

Having said all that, I do have one little gripe with the wouxun, the audio on my radio is a little week on normal fm 5Khz deviation, internal and external mic. I also use it on a narrow band radio system (2.5khz deviation) for work and the reported audio is equal to the Moto's if not better quality? Well that's what I've been told.

P.S. I have turned the FM deviation control to Max.
I have also done the modulation mod, but it didn't seam to make a huge amount of difference for either normal or Narrow band...

I have owned 2 KYD TK-338 Both rubbish, broke after 3 months, I also had a KYD TK-760A, A bit better then the 338, but still rubbish and broke after 3 months too (Repaired numerious times). Next was/is a NEE-768 this one lasted about 6 months, broke, fixed, broke, fix about 6-7 times, it has since been semi-retired. my last repair job has stuck, but it doesn't get much use anymore, but it does still work. Now I have my Wouxun, almost 12 months now, with no major issues with the radio itself, I have had to replace the original antenna (broken) and have had to repair the Speaker mic (Internal broken wire near plug). other than that, my experiance with Wouxun has been very happy.

Having said all that, I do have one little gripe with the wouxun, the audio on my radio is a little week on normal fm 5Khz deviation, internal and external mic. I also use it on a narrow band radio system (2.5khz deviation) for work and the reported audio is equal to the Moto's if not better quality? Well that's what I've been told.

P.S. I have turned the FM deviation control to Max.
I have also done the modulation mod, but it didn't seam to make a huge amount of difference for either normal or Narrow band...

Topic: 2612 Message: 2671

I have consistent reports of excellent audio (2.5kHz deviation for 2m and 5kHz for 70 cms) when I use the built-in mike. I've mentioned before that the audio was very poor with a "brand X" speaker mike, but much better when I drilled a few extra holes in the case of the speaker-mike in front of the mike insert.

Apart from that, 6 months of use (more than I expected because if I am only wandering around locally in the car, it's my mobile too!) and really no complaints. It's a really nice little "grab it and go" rig, and doubles for the license-free band too.

I'm not sure the spare battery has earned its keep though - the radio seems to be about half discharged after a full day or fairly heavy use!

I'm trying to figure how to justify the new mobile next year even if the price is right, as My FT-857 is "supposed" to be my mobile, but doubles as the shack rig, and I also have a 4-channel Yaesu FT-4011 that I really SHOULD mount in the car!

It's good to know that you can get a decent product at a bargain price - the Big Three have had it all their own way on the ham market for too long, but I do hope that it's beta-tested more than the UVD1P, as I'd have been a lot less happy if I'd discovered it 6 months earlier, with the DTMF that didn't work with a lot of repeaters and other bugs (If I buy one, I'll wait until a few of you guys have bought them and make sure all the bugs are ironed out!!

Well then theres a few messages with typos in them as this made no sense and the very poor search and threading on YG makes it impossible to find stuff (one of the reasons I am in the process of moving my 35 groups to phpBB) and the issue at hand is PLL and deviation v. actual frequency seperation ie +5Mhz 450-4699 and +3 470-512 and pretty much any thing goes in VHF.

The narrowband channels are an issue, but for the 2 channels that have it for now I can deal with... hopefully this is dealt with in the future.

Thanks.

Hi

Generally you need to be in VFO mode to programme the frequencies, ctcss, repeater ,shifts etc before you put them into memory . normally you cant just add these things later to the memory they have to be done at set up of each memory/ frequency

Some time ago I did some Tx audio frequency response measurements and posted here. All the KG-UVD1Ps here suffer from low deviation and muffled audio on transmit. The pre-emphasis needs to be looked at as the deviation at 3KHz is way too low compared to 1KHz. Should rise at 6dB per octave. With 1KHz deviation at 1KHz audio frequency, the deviation at 3KHz is only 2.1KHz. I has already done the removal of a couple of capacitors before I did the measurements and an unmodified radio sounds worse.
It is much better than a Yaesu VX6 I have available which sounds so bad that I don't use it! So much for Yaesu quality. The VX7s around here also appear to have the same lack of pre-emphasis except for one that sounds great.
I checked my old VX5 and its pre-emphasis accurately follows the required 6dB per octave curve. It sounds great as do all the Feidaxin FD150 radios in this area. These also have proper pre-emphasis.
I don't understand how most users on this group get such good audio reports with very rare complaints from some others about the poor transmit audio. There must be a problem as there have been modifications published to help with the problem so some others have investigated and tried to fix it.
I would like someone who has good audio reports to do a frequency response check on their radio to see how it compares with what I have found.

The new mobile radio looks very interesting and I am sure there will be a lot of interest. I will be very curious to see what the transmit audio response is like and hope they have got the proper pre-emphasis on it!
Good pre-emphasised audio is essential for good operation of course. I operate mobile most of the time and with the poor transmit audio on an unmodified Wouxun, it is very difficult to hear when in a very noisy environment at the receive end. try listening to one in a Mazda MX5 (Miata) at 100km/h (62mph) with the roof down and you will understand!

2675. My radio won't unlock on the UHF band

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-08 19:56:26 UTC
From: VK3FFFJ
Topic: 2675 Message: 2675

I decided to have a little play with the unlocking software, even after reprogramming the UHF band it wouldn't TX or RX out of it's factory set frequency's, you can type them in, but no recive or transmit, very strange.... I have the 136-174 and 420-520 version I unlocked for 400-520 use, went to 419.995 no TX or recive checked on 1Ghz frequency counter, no TX frequency at all, IE no spurious atleast in the 0-1Ghz range.

It did work on the VHF band, but didn't push it too far.

I have now reverted back to factory setting.

Anyone else had this issue?

Jason

Are CTSS and pl tones synonymous terms?

Yes, To expand on the CTCSS question:
CTCSS(continuous tone coded squelch system) this is the generic term for using sub audible tones to mute the receiver,
P.L. (private line) used by Motorola
C.G. (channel guard) used by G.E.
Q.C. (quiet channel) used by RCA
with a few exceptions all of these systems are compatible with each other...

That is becanse the chip of your model is 420-520 when it was manufactured, and it is impossible to Tx/Rx out of this range even you used the "extended" software to extend the range. Manybe it was only possible for you to change with a chip of 400-520.

Is it possible to enter a Rx frequency of 151.1075 mhz into the Wouxun KG-UVD1P radio. I have attempted to enter the frequency as narrowband and when i enter it i get 151.10625 mhz. instead of 151.1075.

Thank You for any help.

2681. Re: [Wouxun_KG-UVD1] Frequency question

No. That frequency requires a PLL Step Size of 2.5KHz and the KG-UVD1P doesn't have it.
Set the radio to WIDE and see how a transmission from the other station on 151.10625 sounds.

Unfortunately not possible, this radio has minimum step 5 and 6.25 kHz
due to hardware limitation (PLL synthesizer step).

The water/dust-proofing on the head would be very useful for motorcycle mobile! A nice feature too for "portable" operation and ARES/Raynet events

And an intriguing idea to have the head on a mag-mount with mike built in (hopefully a conventional mike socket too as I'm not sure I like the idea of using the whole head, with all the controls as a H/T!)

As for the price - about 300 bucks or under £200 UK - it looks as though Wouxun could have rocked the cosy boat of Kenwood/Icom/Yaesu and started some thinking!

However, this one does not appear to have the dual RX that Wouxun is promising, or the facility to (apparently) turn the rig into a repeater (if they really mean that). We'll have to watch the ham radio press and the internet for reports to see if it's as good as it sounds.

It's a couple dollars cheaper here:
http://www.universal-radio.com/catalog/fm_txvrs/0813.html Surprisingly

According to that it does do dual-receive but no mention of crossband.
Probably the neater thing is the Yeasu FTM-10SR.. it's lower power but
completely waterproof so you can mount it on a motorcycle. That one is also
$199.98. 10w on 2m/7w on 440, it's a bit low power but it has extended
receive and it's waterproof.

The big bummer is that the bluetooth is an optional accessory.. $100 module
plus bring your own headset (or pay $90 for theirs, there are tons for
cellphones under $20.. $90 is just being greedy)

From: John
Topic: 2687 Message: 2687

Today while using my radio, the display just went blank?

Is there a way to fix it, or should I just replace the radio. I lost my channel digits some time bak and now the whole display is gone :(

Any ideas?

I believe a recent post said replacing the display flat cable fixed a display problem. Might be worth a look inside.

Did you leave it facing the sun? That has occured to me with my GPS unit in the car if I place it on the dash. It also will happen to cell phone displays.

If the sun was not the culprit, it may be the mylar has become askew. This was a response from Wouxun once when a radio's DTMF buttons did not work. They instructed to open the radio and simply put the item back into proper position and it should be fine. Not sure if this is your case though. Let us know.

I saw that too... I just hope opening the radio isn't a pain... Perhaps it just worked its way loose... chasing down a cable may be more of a hassle than simply getting a new radio.

Cracked the case.. saw one cable from the mainboard to daughterboard..... made sure the cable was tight,,,,

Got my display back.... the problem with a couple digits is still there... BUT still happy...

Dunno if i fixed it or it got hot..... and needed to cool...

Regardless.. thanks for replies.. I'm happy again :)

It's a fake one :(

Problem happened again.... took battery off and put radio in freezer... after a few took it out and it again works.

Did a full factory reset then reloaded my program....

We will see what happens..... there could be a cooling issue.design falw....

Bear in mind I use this HT a lot more than many do.... every day for hours..... there could be a longevity issue :(

Does anyone have any info on the new KG-869 yet? Is this going to be a dual band with just a limited keypad and a display? If so, that would be the perfect radio for my use.

Word is after the Hong Kong electronics expo then word will come out.

I agree a limited keypad and/or display would be perfect inmany uses... I'm excited about their new product line.

Have programming cable, diskette, USB for XP and listed Channels and Options....I receive a "Read Success" indication on write to radio. Now, I turn on the transceiver and i only get 'Busy" bars ...almost no matter where I'm at in the 145+. Before at least I was hearing talk...now only silence with some static and the green light coming on and 'Busy" bar.
Had the unit since Friday and still haven't be able to get out on it.
I have gone through the CD'sstep by step on the making sure may settings match those in Help....no avail.

Would sure appreciate any help...perhaps someone has already created a checklist/troubleshoot ...on Windows XP (have correct cable program for USB on XP)
Thanks
John

Sounds to me as though you have CTCSS or DCS receive turned on, perhaps also with squelch open. Set menu option 15 to 0 and menu option 2 to 5.

I think you should get a "write success" on successfully writing to
the radio, not a "read success".

Try reading from the radio first, then load the file you want to use to
program the rig, then write that to the radio.

Bill

I'd say first step would be to try simplex. Do you have another 2m ham reasonably close? Or another known good 2m transceiver yourself? Power meter or even an SWR meter to check if RF is coming out on TX?

Got the 600KHz repeater offset the right way? Here in Tasmania ours
are nearly all a minus offset but a couple with a postive offset can
trap one fairly easily. When you try transmit doers the display show
trhe frequency changing to the correct transmit frequency?

2709. Channel knob

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-12 13:03:05 UTC
From: Garrett
Topic: 2709 Message: 2709

Can anyone that may have multiple radios check to see if any taller channel knobs from another radio will work on the KG-UVD1. I would like to have a taller knob that works better with gloved hands. I know radios like HT1250's have pretty tall knobs.

Dumb question, but are you sure you've got the offset direction right? (I'm sure things have changed a bit since I left Dallas, but if you can't get into 145.19, you've got issues. ...)

Also... the display kind of works.. it appears that the display is just so very dim that you cannot see it without moving it at an angle and looking real hard. It is like the contrast settings are off.

Sounds JUST like a display that has been left in the sun and allowed to get hot. But normally (I work in the Middle-East at times, where it gets quite warm some times!!) it reverts to normal as soon as it cools off. Have you allowed it to get hot? Does anyone know if the effect can be permanent?

>
> That's my issue as well. All I can tell you is what I'm willing to pay for it - which is not $350. Much more than $200-250, and I will purchase a second FT-8800 instead due to the fact I already have programming cables, great software, etc. for my other one. Wouxun HTs sell well because they are a good deal for a functional radio for the price, but they certainly lack some of the bells and whistles that a similar Yaesu or Icom offers as well as the name recognition. If they believe they can get nearly the price of a Yaesu or Icom product, I think they'll be disappointed. My $0.02.

I think this is exactly where I screwed up... Do you have this wouxun handheld? Messed up the programming....
I think I entered the CTCSs as a Decode, not as Encode. And I gave the RX frequency the same as the TX Frequency.
Very much a newbie.. Just my tech license about 10 days ago.. And seller of the KG-UVD1P dual band doesn' program any repeaters!!!!
Ouch ... Sounds as if you are a vet of Ham! And you used to live here.
Our instructor gave us a sheet showing "Output Frequency" and "Input Frequency" and directly underneath it shows (below and between the two columns.."145.17-".... Next Column is Call Sign, next column "Repeater notes" ... Exp: 110.9 (CA), next column CTCSS Tones "110.9" , Sponsor: DCARA
I have a full page of these....
Stupid question .... If negative offset like this example... In my table wouxun gives me would I list 145.1700in the "RX or TX " frequency Column, etc
Thanks for you help...

That sounds like it!

The problem with "input" and "output" is knowing whether it refers to the repeater or the radio!

In UK, our 2m repeaters transmit 600KHz lower, and input/output refer to the repeater, not the rig - But considering the different names you have for CTCSS (PL etc), and that odd "standard" used by nobody else in the world for cell-phones (HI) this may or may not apply to guys in USA!

Well done getting your Tech license - I'm struggling with my XYL and the UK equivalent "Foundation" license. After a month I was almost ready to give up, but suddenly she understands Ohms Law and has got pass scores for several "HamTest" mock exams. It's gonna cost me another UVD1P as and when she passes though!

Hey John,

That would have a minus offset, so the input (tx) frequency is 144.57. You definitely want to be sure to set the transmit tone, and it's usually safe to leave the receive tone off. No worries, it really does get easier, and congrats on the new license.

I have had two of these radios for several months. I got them to use around home while working. Figured at the price, if I lost one or damaged it, it was not the big loss like my VX-8.
today started off as normal, fresh battery, check that it was working and hook to the belt with the mice-speaker clipped to my shirt. Needed to finish some work on the driveway spreading some gravel. The tractor is a 20hp Kubota.
Well to make a longer story, the radio fell off my belt and under the drive wheel. After stopping, the major damage was to the belt clip which was destroyed. The display window was pretty scratched but with a good wipe, everything worked.
This little radio appears more rugged than I had figured. I am pleased with it.

I know the Kubota 20hp - it's a "garden tractor" but it's still not LIGHT!

I've been told the Wouxun is robust, and I've dropped mine a couple of times, but THAT really does say something!

That's good to know. I also have a Kubota (BX-23) and use the radio on it
all the time. I won't try that with my snow chains on though... :)

Does that mean I have to be more careful with my radio when using my 46 Farmall or Kubota B7200HST?

Kidding aside, that story speaks wonders of the value and craftsmanship of the radio.

That's good to know. I also have a Kubota (BX-23) and use the radio on it all the time. I won't try that with my snow chains on though... :)

I have had two of these radios for several months. I got them to use around home while working. Figured at the price, if I lost one or damaged it, it was not the big loss like my VX-8.
today started off as normal, fresh battery, check that it was working and hook to the belt with the mice-speaker clipped to my shirt. Needed to finish some work on the driveway spreading some gravel. The tractor is a 20hp Kubota.
Well to make a longer story, the radio fell off my belt and under the drive wheel. After stopping, the major damage was to the belt clip which was destroyed. The display window was pretty scratched but with a good wipe, everything worked.
This little radio appears more rugged than I had figured. I am pleased with it.

Ed,

Nothing to do with HT's...Is that a 4 cylinder, crank start Farmall Cub? I mowed a lot of acres with one of those on my grandfather's farm. I don't want to say he was cheap, but he was a born and bred Yankee. I mowed with a drawn sickle bar behind me

Re scratches on plastic display, I have had very good luck using polish designed to take scratches out of plastic displays. It's sold at auto supply stores, and can make the display cover look pretty close to factory new.

No, it is an electric start (or crank up) Model "H". I primarily use it for drag. I drag a 12-disc disc harrow and finish off with an 8' long 6" "I" beam for a beautiful finish surface.

Well, we need to be realistic, otherwise it won't make sense for them to produce it at all (if they can't make a decent profit).

The mobile radio appears to be 1.5 of the HTs (true dual receive, plus some HF reception capability), and a 50W amplifier on top of that.

If you can get a 50W amplifier and a single band HT for $60 (ie, the difference between the HT and the $160 price you mention) then you can build your own setup for the price you want.

Of course, I'm still hoping it comes in low at $200, but that's the price I can pay - not the price it's worth.

We'll see soon enough. I expect that even at $300 they'll sell well, but they just won't sell to me (not because I'll buy from the big boys, but because I can't justify the cost for my own usage of it)

Keep in mind that while brand recognition and respect is good, Wouxun has already proven themselves capable with their HT. They've garnered a lot of respect since they introduced that into the US market. The kicker is that most reviews are still stating, "I buy this because it's disposably cheap and it has enough capability and features to meet my needs." What they aren't saying is, "I buy this because it's better than brands X, Y, and Z, and even if the price were comparable I would still buy this."

I think they will still need to have a _significant_ cost advantage, and prove their reliability over another few years before they get from quote A above to quote B.

I have bounced my Wouxun on the pavement a lot. The belt clip is not great. Falls off when you don't expect it, sticks to you when you need to grab it. Sigh!

Lost a pager under the back wheels of a Western Star fire truck, and have an Icom H2 that fell off a police car and was driven over by the next.

Speaker-mikes make a great tether line.

Scenario 1:

My dear XYL is taking her Foundation (UK "beginners") exam in a few weeks. She's getting quite good and I'm fairly certain that she'll pass. She will want at least an H/T rig initially.

So, assuming I have unlimited cash, will I buy her a Yaesu (or Icom/Kenwood) or a Wouxon? What are the ups and downs?
a.. Wouxun has rubbish software
b.. If you buy from China direct, your "warranty" will be expensive if you get a problem
c.. You can't make a local phone call to China if you don't understand something
d.. How does the performance of Wouxun compare with the others?
e.. How do the features compare (and I don't care about the vhf broadcast radio)
Well, we have a very good "support" group here, and there's now distributors in UK and USA (probably others too, which wipes out a couple of the questions above). Let's face it, most of us are licensed hams and know a bit about electronics!

With "unlimited cash" it would take a lot of persuading me to buy anything other than a Wouxun. The late-model UVD1 does everything I want it to (okay, I'm greedy, I'd like 23cms too!) and I'd buy it from a distributor in my own country for £100 or whatever it is in local money. I just don't see that the Big Three have anything extra to offer in terms of performance and features (apart from APRS, and that can be a $50 plug-in for a Wouxun)

A nice dream, but as I'm poor (!) my choice is to buy a UVD1 from China or pay a bit more for the added support and buy it from a local dealer. As yet undecided on that one, but I think local dealerships are a big plus for the brand and the XYL's will probably come from ML&S in UK

Scenario 2:

I'd like an FM mobile to free my Yaesu 857 to stay in the shack, and not have to move it in and out to the car. I don't want SSB or HF in the car except if I'm doing "portable", so 2m and 70cms FM is plenty for me. Let's now accept that I'm "poor", and can't afford one of the offerings from the Big Three, and the new Wouxun mobile comes out at half the price of the others.

Would I buy the new Wouxun mobile from China? Or even from the local dealer? I think my initial answer would be "No". I was lucky to find out about the Wouxun H/T after the initial problems (short tone duration etc) and unless the mobile came out at an UNBELIEVABLY cheap price I think I'd wait a while and let someone else beta-test it!

Keep in mind the marketing aspect of price. Wouxun is trying to gain market share and is probably willing to sell at a loss until they gain their target share. The new Yaesu dual band sports mobile mentioned above is a great little $300 radio so I'm truly expecting a new, unproven Wouxun dual band mobile to sell for around $200.

Brian,

The carrying case will keep excessive dirt off the majority of the radio case but won't protect it against running over it. It is a soft leather case with a clear window for the display. It also comes with a nice strap for around the neck or over the shoulder. I like to hang it over the backrest of my passenger seat in my truck (unoccupied by passenger). It has two nice strong snaps if you want to remove the strap.

I like the case on my own personal Wouxun but it is difficult to charge the battery because you have to remove the case to insert the radio in the charger. That's the only down side I guess. At a price of only $8 I guess you can't go wrong.

Regards,

Ed

True ;-)

My fault here, I took the scratches off out of context into the
generalities of keeping away scratches.

Obviously not much good when there's a 2 ton truck involved ;-)

Since we have been talking about abusing our radios, I've been asked about the water resistance of the KG-UVD1 and the KG-UV2D radios. Although they are not billed as having any water resistance, does anyone have any experience with these radios as they relate to getting wet. I'm not looking to drop them in 3 feet of water for 30 minutes but just looking for information on them getting wet from being on your belt in the rain.

Thanks and 73,
Keith

It should be ok in light rain. However, it does not
Have all the rubber seals that a Vx-7 has. The speaker grill is slanted down but not sealed like a waterproof radio is.

Don't drop it in 6 inches of water.

>
Had some rain no problem.

BUT... opening mine to try to solve my display issue, it appears the radio has EXTENSIVE rubber seals everywhere possible.

If you remove the antenna and look inside, you will se an orange ring.. this is part of the seal that protects the radio. If you open the radio to expose the circuitry, the same seal is there around the chassis.

My guess is it is fairly well protected.

If I replace my radio with the bad lcd, I may "dunk" it and see how it fares, provided I haven't broken the weather seal. who knows.. my lcd problem could lead to possible ... destructive tests...

Subject: Re: [Wouxun_KG-UVD1] Re: First it fell, then the tractor ran over it

Brian,

The carrying case will keep excessive dirt off the majority of the radio case but won't protect it against running over it. It is a soft leather case with a clear window for the display. It also comes with a nice strap for around the neck or over the shoulder. I like to hang it over the backrest of my passenger seat in my truck (unoccupied by passenger). It has two nice strong snaps if you want to remove the strap.

I like the case on my own personal Wouxun but it is difficult to charge the battery because you have to remove the case to insert the radio in the charger. That's the only down side I guess. At a price of only $8 I guess you can't go wrong.

Would it be better to invest in a carry case for the rig ?

I consider them pretty essential for ALL of my handhelds.

By far the biggest cost of "our" radios compared to, say, CB rigs,
is the cost of the final amplifier. This is what makes hamradio
more expensive to produce than some of the low-power kit.
Wouxun will have the same challenges.

There have been developments BTW: it used to be that one would need
separate "power bricks" for VHF/UHF. These days, a single MOSfet
does all.
In that regard, it is interesting to study the diagram of, say,
the Yaesu FT7800 as it is a remarkable piece of engineering
in this regard.

The FT817 uses the same pair of MOSfets for 1.5 - 450 MHz,
5 watts out, linear mode, all the way from DC to UHF.
Yaesu engineers do have my respect.

Hi friends,

Has anybody every noticed that it's really a pain to organize channel memories for the KG-UVD1P using the Wouxun programming application? For example, if you divide channels into categories and then you decide you want to "insert" a new channel at a specific place, there is no way to do it using the Wouxun software.

Well, I have created an Excel spreadsheet that reads from and writes to the "TW" file, and lets the user sort channels, copy and paste, and edit all channel parameters. I've used it for a while and I have not had any problems.

I'd love to make this available to anyone/everyone, but I have too many commitments to really be able to support users and help people solve problems (some of which could possibly be due to unknown problems with the spreadsheet). And I really don't want to instigate a situation where there will be a bunch of frustrated people trying to use this spreadsheet application.

Therefore, I wish that some benevolent person who has good Excel skills will look at what I've produced, and then consider being a support person. I'll be glad to explain exactly how the spreadsheet was designed and how it's supposed to work, and there is nothing "protected" or "hidden" in the spreadsheet -- i.e., what you see is what you get. This person could then perhaps write some simple instructions for users, and could also make some kind of effort to help folks who have questions. This person could also make improvements, and my intention would be to help if there are any problems or questions... I just think that it is much more realistic for me to handle inquiries from one person who has an Excel background than for me to help everyone who wants to use this.

The spreadsheet for the most part just uses common Excel functions, although there is a lot of use of lookup functions (like VLOOKUP). There are also a few very simple VBA macros. (This is the first time I have done any VBA programming and I was trying to avoid it, but it turns out that using simple VBA macros was the simplest way to read from and write to the "TW" file, and to do a few other little things.

Right now the spreadsheet only reads and writes channel information, but it could be expanded to read and write any other functions in the radio. However, it seems to me that the Wouxun application software is not too bad except for when you want to organize and edit channel information.

Is there anybody who might be qualified and who might be interested in helping with this?

(And in other news, I have done some preliminary work in collaborating with someone who has written full-featured software for several other amateur radios to port his software for the Wouxun. I'm hopeful this project will go forward.)

I was not able to see your message earlier due to QRM at my end.

I had exactly the same problem and I was able to solve it by replacing the flat cable between display card and the main card.

You may get several types of flat cables not exactly having the same length or number of connectors but don't worry. If you get a cable of similar length (a bit longer also fine) but having more number of connectors just cut off the extra connectors carefully only at both the ends using a sharp scissors. You have to lift a small locking flap in the connectors to release the cables and similarly once the ends are inside the connectors relock them.

If you find very long cables (used extensively in DVD players) please cut the cable to appropriate length, scrap the paint from top of the connector, remove the backing strip from the end of connector which is not to be used.

Opening the handy is very simple. Just open two screws after removing the battery pack and remove the knobs, pry open the main board carefully and that's it.

Hope this works,

VU3SEG

Are you using one of the buttons on the left side of the radio or the SCAN* button on the keypad to scan with? If you are using the buttons on the left side of the radio then you can reprogram that button in the software to do other things including only to use it to turn on the backlight momentarily.

Hi David,

Sounds like a great piece of work, where can I get a copy?

I was looking at decoding the Wouxun communication with a comm-tap but never got around to it - I barely have the time to turn on my radio and scan let alone get into another software project :) But I would like to keep up with your project if I get some free time.

I did want to suggest one thing though. I use SourceForge.net for hosting Free/Open Source projects that I work on. As the original developer of a project like this, you can create a free account and post your work. For each project you create you will have you own discussion area, bug tracker, mailing lists, etc. It can be a 'hub' for developers to communicate and prioritize new features.

Anyway, just wanted to put it out there considering you are open to sharing your work, a tool like SourceForge can help it live on and be accessible to a new audience of users and developers.

-Dave

Les,

No matter which button I use to initiate scanning, either the upper side button or the dedicated scan button on the front, initiating scan turns on the back light and it only goes out after the radio has been locked onto a carrier for a while, or when scanning is stopped manually.

If the upper side button is set for Lamp, pressing that button (to shut off the light after scanning has begun or resumed) also stops scan.

Like I said earlier, I think this aspect of the radio is a "feature," much like the RX signal strength indicator, and we can't do much about it.

One local mobile shop was clearing out some Yeasu-Vertex hard cases with a D attachment. They cost us each about $40 Canadian, our most pricey accessory.

My radio ends up in up in my jacket or pants pocket, so a hard case is out. My turn-out jacket has a radio pouch which won't accommodate the case so as much as I would like the radio goes naked. Most of the time when I'm driving it's clipped to the visor

Thank you, Dan. I stand corrected. My brief test: If you turn off the Backlight in the software menu and set the upper side button to "Lamp," then the lamp will not come on at all until you press the upper side button. In that case, the lamp will come on for four seconds, more or less, unless you change the channel or press another button, in which case the light goes out immediately.

If you leave the upper side button on something other than Lamp (say, Radio), the backlight will never come on, as far as I can tell, until you allow it again in the software menu.

Ya learn something every day!

Sorry Kent, I have to disagree with what you said about the speaker, I Have taken my radio appart, the speaker is a plastic film type, and my radio has/had plenty of Glue where the speaker is fitted into the radio, so I doubt that any water will get through there, However, the Microphone hole is, well, a hole and water will get through there, but it is only a small hole after all unless someone's been at it with a 3 or 4 mm drill bit.
The reason I said has/had, is because I had to remove my speaker and clean off Iron fileings that had been attracted to the magnet (I work in a factory with LOTS or sparks from spot welding equipment).

OK, well I have not taken mine apart...yet.

The battery case does NOT have a seal where it attaches to the back of the radio, like the VX-7 battery does. And, of course the mic/earphone connections are not waterproof like the crazy, expensive, hard to get plug for the VX-7 and VX-8.

Although they are not billed as having any water resistance, does anyone have any experience with these radios as they relate to getting wet. I'm not looking to drop them in 3 feet of water for 30 minutes but just looking for information on them getting wet from being on your belt in the rain.

How do you start scan from the key pad I have been trying but have not cracked it yet.

Les,

No matter which button I use to initiate scanning, either the upper side button or the dedicated scan button on the front, initiating scan turns on the back light and it only goes out after the radio has been locked onto a carrier for a while, or when scanning is stopped manually.

If the upper side button is set for Lamp, pressing that button (to shut off the light after scanning has begun or resumed) also stops scan.

Like I said earlier, I think this aspect of the radio is a "feature," much like the RX signal strength indicator, and we can't do much about it.

Very simple; press and hold the scan key (to the right of the 3 key) for a second or two and it will start scanning.

Nice. Looking at it on my Blackberry. It looks like it has SO-239 antenna, which, if that is the case, is nice to use a 'standard' American connection, instead of the goofy SMA-F.

Thanks,

"N" type connectors are supposed to have lower loss when used on Higher frequency's (UHF+) than the SO-239 to my knowlege SO-239 are fine for HF up to low end VHF but tend to get a little lossy higher up the bands. I know I probably should post data to back up those thought's, but I'm just about to leave in about 45 seconds.

2776. UV2D or UVD1P

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-16 08:10:58 UTC
From: lou0151
Topic: 2776 Message: 2776

Hello all...

New to the group here, own a few Puxing 777+'s in UHF & VHF... lost one and am considering the KG-UVD1P.

I've have read / seen that woxun.us and dbjre.com have the UV2D on the market.

Is there any material functional or performance difference between the two units?

I'd also like to ask if anyone can confirm if any Kenwood 2 pin mic / headset acc. are compatible as well as the Puxing 777+ programming cable ... or do i need to purchase the Wouxun programing cable.

Many thanks in advance.

Dave's right - the SO239 is quite a bit more lossy. However we are talking about an FM mobile rig here - not a DX Box! And most mobile antennas for 2 and for 70 are fitted with RG-59 and SO259 plugs - hardly a low-loss setup. And a plug-adapter from the antenna cable's 239 to an N on the radio won't fix that

Topic: 2776 Message: 2778

Seems to some confusion over what it is called, but there would appear to be some sort of new version - be it a UVD2 or a UVD1V2

From what has been "leaked" so far, the only apparent difference is that the pictures seem to show a metallic finish to the plastic outer case. One web site mentions "improvements", but does not say what they are (the copper colour maybe?)

As I'm soon going to buying my second rig (nothing wrong with my first one, I love it, but the XYL now needs one too) I'm strongly leaning towards the UVD1 that I already know - I don't want to be a beta-tester for the new version if it really is different, even, better!

As for the cable - I can never remember if it's the Kenwood or the Trio that is compatible with. My speaker-mike and audio cable for "data" is compatible with one or the other. But you will need to be sure that all the pins required are wired-through; some cables that you buy with just the "double-plug" and a foot of bare ended wire do NOT have all pins wired. Can anyone else who has "converted" from being a Puxing or Kenwood user advise about the programming cables?

Stu

I've just looked at the DJBRE site (in case there's more real information - there's not).

The nice close-up picture shows some sort of colour (looks like mauve) at the bottom corner of the case (possibly due to the lighting) but apart from that it LOOKS exactly the same as my UVD1P. That's not to say there is no functional difference (but there's no information on the site)

Yet another version of the name - KG-UV2Da
Description: (appears to the same as the UVD1P)
This radio is a 2meter-440mhz HT. . . . . **(136-174&350-470mHz RX)**
(144-148&420-450mHz TX) Software Modifiable (Is that "official" now, and covered by warranty?
1 Penny shipping and Insurance to USA only.
Retail Price: $175.00 - DBJ Price: $120.49

I'm not really impressed when folks say "Retail Price . . Our Price . . . " Where has ANYONE seen the Retail price of $175?

As for "One Penny Shipping . . . Does that mean that you can buy it for $120.49 if you live in the next street and walk to the shop - but it's $120.50, a cent more, if you have it shipped to New York or California? I'd not bother to walk the half a block for a penny!

Looks like still NOBODY knows what is the score with either the UVD or the new mobile, and I have a lot more respect for the vendors that admit this and only post FACTS on their web sites that they are sure of. Before I make any decisions, I'll wait to hear from a couple of vendors on this forum who don't 'BS' us. I probably won't be able to buy (economically, for shipping) from them as I'm in UK, but at least I'll have real information to go on before I buy from a UK vendor.

There's an interesting parallel here in UK; You may have heard of BaconSalt (and derivatives) and the manufacturer of that (in Seattle) has now come up with a new "seasoning salt" called MaltSalt, that you can use with good old British Fish 'n Chips. One sub-distributor in England went overboard on advertising and taking orders! before he even knew when it would be available. Now his customers are not happy because he gave a projected delivery and the manufacture went a week behind schedule - I know, because I am the main importer for UK and Europe! The goods were at last shipped to me on Thursday, and are likely to arrive Thursday or Friday next week by USPS "Flat Rate".

Summary? If I think you are full of it, there's no way you'll get my business!

Hello all...

New to the group here, own a few Puxing 777+'s in UHF & VHF... lost one and am considering the KG-UVD1P.

I've have read / seen that woxun.us and dbjre.com have the UV2D on the market.

Is there any material functional or performance difference between the two units?

I'd also like to ask if anyone can confirm if any Kenwood 2 pin mic / headset acc. are compatible as well as the Puxing 777+ programming cable ... or do i need to purchase the Wouxun programing cable.

Many thanks in advance.

I have the UV2D from wouxun.us.

The trim around the front of the UV2D is a shiny dark copper color instead of the pebbly black on the UVD1P. Also, I understand the only functional difference between the two is the UV2D can flip between channel and frequency modes by pressing MENU TDR, and if channel mode is in, say, NAME, it will be preserved when returning to channel mode.

I don't have the UVD1P, so I can't test any differences to see if there are others.

2785. SO-239 Receptacle

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-16 13:48:20 UTC
From: DavidO
Topic: 2785 Message: 2785

The SO-239 receptacle does not have a uniform impedance over the length of the connector. As a result it presents an impedance mismatch to the system in which it is used and this mismatch causes a power loss to the load (antenna). That's why the BNC and Type N connectors were designed. They are a 50-ohm impedance from one end of the connector to the other and cause virtually no (impedance) mismatch losses in a 50-ohm system. For the purist, SO-239 would not be used over 300MHz, or even a lower frequency in systems running low power where insertion and mismatch losses become significant.
The SO-239 does not have an impedance of 50 ohms.

Respectfully,
David

If that is the only difference, then I might go for one. The small change in the mode switching will make it easier for the XYL (!) and also the copper colour will stop her picking up mine by mistake and scrambling my channels HI!

Nice. Looking at it on my Blackberry. It looks like it has SO-239 antenna, which, if that is the case, is nice to use a 'standard' American connection, instead of the goofy SMA-F.

Thanks,

For example, if you divide channels into categories and then you decide you want to "insert" a new channel at a specific place, there is no way to do it using the Wouxun software.
>
> Well, I have created an Excel spreadsheet that reads from and writes to the "TW" file, and lets the user sort channels, copy and paste, and edit all channel parameters. I've used it for a while and I have not had any problems.
>
> I'd love to make this available to anyone/everyone, but I have too many commitments to really be able to support users and help people solve problems (some of which could possibly be due to unknown problems with the spreadsheet). And I really don't want to instigate a situation where there will be a bunch of frustrated people trying to use this spreadsheet application.

Why not just place it in the "files area" with a health warning? From what you've posted, the utility looks very useful and it is generous of you to offer it to the hobby. Users can't expect you to maintain it as well (although some will!).

Mert,

That is true, but according to the review in QST magazine, the differences are as follows:

UVD1P: When you switch to frequency mode using MENU TDR and then back to channel mode, channel mode reverts to CH. So, if you were at NAME in channel mode, switched to frequency and back, you will lose NAME. You will have to reset it to NAME using MENU 21.

UV2D: Switching to frequency mode using MENU TDR and then back to channel mode, the radio retains the channel setting (i.e., NAME stays in effect). Not a big difference, but one I like.

All, I have already managed to scrape up the dark copper finish on the UV2D whereas I have never made a mark on plain black polycarbonate. Something to keep in mind when deciding which rig to purchase.

Jay,
I think there is a mistake at the review, because I newly purchased a KG-UVD1P (oct.2010) and I named the channels.
allways using in name channel mode.
When I press to Menu and TDR buttons it changes to freq mode and when I press them again channel mode “with” names come back.
it doesn’t revert to ch mode without names.
I think there is a mistake at the review or they updated the firmware.

Hello Mert,

Each time I think something is settled for this radio, I find something else! Thank you for the updated information. By the way, my firmware is J09, as shown on the serial number. I am curious if your firmware is the same.

Your new UVD1P probably has updated firmware; that makes sense. Given that, people may want to buy the UVD1P instead of the UV2D. I just don't think the dark copper finish is going to hold up very well unless the radio is kept in a case.

Topic: 2721 Message: 2795

Well, this may be the final insult on this topic.

I went to town, Paris, TX to see my friend Richard at MTC for a new belt clip. Also on the schedule was a stop at the local Kubota dealer to investigate some parts. I made the first stop, got the new belt clip and off I went to the tractor dealer. I had my model and serial for the tractor that ran over my radio so this was going to be easy. When I got to the dealer, I was informed that my tractor was an "illegal alien." The model was not one sold in the U.S.. It was only sold in Japan and not approved to export. The dealer told me they are not allowed to provide any support. I am concerned about the international implications here. An "illegal" Japanese tractor runs over a small Chinese radio. This may be the start of something big.

I guess my best coarse of action is to paint the tractor green and call it "Deere".

Warm regards from
Pecan Gap, TX

Unless there is a plastic insert (rather than air)... then the
impedance would be 75-ohm... And used for video, data, etc.
Sorry... Just being a smart a$$... :-)

Why not just place it in the "files area" with a health warning? From what you've posted, the utility looks very useful and it is generous of you to offer it to the hobby. Users can't expect you to maintain it as well (although some will!).

From: VK3FFFJ
Topic: 2800 Message: 2800

I have found some secret key strokes, other than the dealer mode, I guess that others have played about too, but here's what I have found on my radio

while holding the number "3" down and turning radio on i get this message on the screen

"UVD1P
820V"

It stays on the screen till I press a key then "reboots"

while holding the number "6" down and turning radio on I get into the simular screen as holding down the "8" key (dealer mode), the radio seams to be waiting for a passcode, you can type numbers, but none of the numbers I have typed so far have done anything...

Holding down the "9" key also does the same.

I wonder what these other settings/mode/things/widgets are?

BNC's are known to me as Bloody NoGood Connectors. They are noisy when susubject to air oxidisation and impossible to clean afterwards, and lack power handling.

N-types work well and offer proofing againsts water ingress.

The losses of an SO239 at 400Mhz or so are minimal and in such amateur systems there's rarely a utopuic requirement to have anything 50 ohms
;-)

Th elong oand the short of it is that in practice an SO239 is perfectly good enough at 70cms.

So's an RCA Phono connector, I use them all the time.

>That's why the BNC and Type N connectors were designed.
>They are a 50-ohm impedance from one end of the connector to the other

If that were the case then you should be checking the feeder cable
you use and worry about that.

Even feeder cable from the same batch will often exhibit variances
in production.

The density of the dielectric will vary, and it's diameter will vary along it's length, the impedance will vary and so will the phase characteristics.

If you were to apply your argument to connectors, then all those
users who use commercially made VHF/UHF antenna with a piece of
RG174 spliced to some RG58 (to enable the cable to pass through the
rubber seal of an automotive door) should also be questioning the
integrity of the splice which would be far worse in terms of having
a non constant impedance.

It would be much worse, but we are only comparing losses in the
magnitude of tiny fractions of a db, so why bother ?

"ham.tw" isn't UK repeaters, it seems to be US ones.

"rp-chan.tw" is the UK ones and it has the "key lock" set in the "usable function" page (as does "ham.tw" one).

Motorola in their wisdom (?) brought out a mini-UHF that they use all the way up to 900 MHz without noticeable ill effect. If you have multiple connectors in a long run, you can get impedance bumps. The absolute best IMHO is the General Radio GR-874, it is genderless and used in precision applications. It is bloody expensive and now only available surplus.

BNC in vibration situations are self locking as are UHF if snugged tight (without a wrench, thank you!)

Most type N style have a hole in the shell to lock-wire in place.

Te internal dimension of TNC/BNC and N are the same(ish) and you can lip an N-male onto a BNC/TNC female. There is a variation on he center pin so don't do it a lot.

We had a fleet of GPS equipped vehicles that had TNC and SMA which required constant re-tightening. We tied the two cables together with Ty-wraps closed to the box which solved the vibration issue.

My biggest complaint with the UHF is the center pin fingers on the females loosen with age and must be either re-bent carefully or replaced.

Does it mean that SO-239 antenna is better to use for HF, VHF frequencies, and "N"type connectors are supposed to use for UHF and even higher frequencies.

Could you show the pics of these two types of connectors?

N type are better in virtually any application, provided of course
there is room to fit them. Way back when the S0-239/PL259 combo first
appeared, around World War 2, they were called UHF type and sometimes
are still referred to as such. Way back then though, 30 MHz was regarded
as UHF!

KG-UVD1P
136-174MHz & 400-480MHz version
J01 serial number

I have an odd problem with my UVD1P. When I switch to VFO mode from channel mode, I lose sound. I still recieve, and if I reboot I still have the startup beep sounds, but RX sound is muted. Even if I switch back to channel mode the RX sound does not come back. The only solution is to turn the radio off for an hour or more and try again.

Any ideas what the problem might be, it didn't used to do this. Is there a fix or am I stuck with this problem?

Dumb question. Are you sure you don't have DCS or CTCSS squelch on your channel mode?

Yeah, I'm sure.
Not a dumb question at all, often times the simplest answer is the best.

Going into dealer mode and selecting "reset VFO" from the menu fixed it. Thanks for the suggestions!

From: Stu Nutt
Topic: 2811 Message: 2828

I think what is meant is to switch to an adjacent (silent) channel, switch on the light, then go back to the active channel. That seems to work for me.

Not perfect, but good enough, as you only miss a couple of seconds of the active channel.

2829. Wouxun KG-UV920R vs Kenwood TM-V71A

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-18 15:59:49 UTC
From: steve_ve6vs
Topic: 2829 Message: 2829

There is an interesting simularity between these two radios. The KG is nioer looking. A quick search for the Kenwood shows list at $430 but more typically around $375

We paid almost that for a used Motorola 32 channel UHF that doesn't even offer full commercial coverage so we had to drop some SAR channels and then paid $90 to have it programmed, which the dealer still managed to do wrong.

Hello,

I have a pecular problem with KG-UVD1P Dual band radio. This radio i bought almost 4 months back since then this radio was working fine. But today i noticed a problem that the key-pad is functional in Rx mode i can key-in the frequency directly with the DTMF tone audible. But when i want to use DTMF tone in Tx i am unable to hear the DTMF tone with full volume.

Any help will be appreciated

Thanks in advance

Shenoy

Well .. looking at it more closely ..
I should assume that 5X means 5 of them?
If so, why not just say the auction is for 5 of them?
Its a good price then of course..

Who knows .. lol
I'm enjoying mine.. and the ARRL / QST review was interesting.

Hello,

I have a pecular problem with KG-UVD1P Dual band radio. This radio i bought almost 4 months back since then this radio was working fine. But today i noticed a problem that the key-pad is functional in Rx mode i can key-in the frequency directly with the DTMF tone audible. But when i want to use DTMF tone in Tx i am unable to hear the DTMF tone with full volume.

Any help will be appreciated

Thanks in advance

DTMF are the number keys and the ones you mention - the latter are the
A,B,C,D, # etc.

If i am not making a mistake the 4 x 4 keys keypad is a "Dual Tone Multi Frequency". Each row has a unique frequency in-band signalling tone. So when you press one key the the matrix of 4 x 4 generates a 2 tones signal.

ie.,
DTMF keypad frequencies
1209 Hz 1336 Hz 1477 Hz 1633 Hz
697 Hz 1 2 3 A
770 Hz 4 5 6 B
852 Hz 7 8 9 C
941 Hz * 0 # D

for Example say when you press 5 the 770Hz and 1336Hz tone signla is generated.
I am facing a problem is it does not generate any tone when i press any of these keys in Tx mode. But able to listen to key press tone to in Rx mode when i enter the frequency and all other function. Seems like the dtmf code generator is gone QRT.

Your post title says KG-UVD1 NOT 1P. The original KG-UVD1 did not provide DTMF according to early users. The KG-UVD1P added DTMF.

This has been true about many radios for a while now. It's always puzzled me because they could have easily just listed a bunch and let people buy the quantity they want. There's not even a discount for doing it.

Dear Shenoy,
When you are entering freq. numbers in RX mode, the rig does not generate DTFM tones. it is only the key press tone that has been generated (at least in my rig it’s so)
are you sure of this.

And it appears they come with a speaker/mic and the cord for car charging. That works out to $107.10 each with some accessories. I don't understand why some of you are so spun up about it. It doesn't seem too outrageous to me. It's less than the $120 US price of just radio if you are willing to deal with potential hassles with shipping and a dealer a long ways off.

Sorry for replying too late as i was out in site. First i would like thank you all who has responded to my posting. i knew that you can not listen to DTMF tone in Rx mode so ia had also replied to your first mail mentioning about it. It typographic error from my side, sorry for causing confussion. i would like to quote once again that i am able to listen to key press tone when it is in Rx mode nut i am not able to listen to DTMF tone while holding the PTT and pressing any of the keys.

I know you all have more experienced in ham radio i need not explain it you guys. Just wanted to make myself clear what i know is it true or false. You'll may have experienced this in while working on CW mode, when the morse key is pressed down you hear a side-tone in the speaker for that duration key pressed down. During this operation the Rx pre-amp Audio o/p stage will be in mute mode and not the AF Amp in TX mode. So you hear comfortable sidetone which suits your ears, same is the case here even though the Rx Pre Amp Audio Stage is OFF the AF AMP will be ON so when you press any key in TX mode hear a DTMF tone. The Audio o/p Stage including speaker never goes OFF it is ON in RX and TX mode provided there is no audio feedback in TX mode (as explained the pre-amp is mute'd).

Hope i have made clear abt my TRX condition

Regards

Shenoy

Tim,

It's all in the way you "spin" the numbers.
In my business, if you purchase $75 worth of accessories, I offer you the radio for only $45 making the total purchase at $120 from a reliable U.S. dealer with warranty and service easily available.

And it appears they come with a speaker/mic and the cord for car charging. That works out to $107.10 each with some accessories. I don't understand why some of you are so spun up about it. It doesn't seem too outrageous to me. It's less than the $120 US price of just radio if you are willing to deal with potential hassles with shipping and a dealer a long ways off.

And that is a most excellent reason to purchase from you.

When I need another of these radios I would certainly purchase it here in the US now that we have that option. It just seems odd to me that folks are getting so excited about their being a seller who is doing something different.

By the way, I know everyone including myself is excited about the upcoming dual band radio. Is there any possibility of an inexpensive, no-frills 2 Meter rig that has a data port? The Yaesu FT-1500 was a perfect example. When they were new they sold for $119. Now used ones frequently go for $150. I realize that type radio goes against the current marketing trends but it would sure be great for all of the EmComm people trying to build digital go-kits and networks.

73,

Tim N9PUZ

Thanks Jerry.

For the moment I have solved my need for DTMF switching tones storage by using a Puxing 888 that a friend has lent me. It allows storing up 9 DTMF strings for each memory location.

I want to re-think my last post- If you are not very near the transmitter site, then intermod is a good suspect. I use my KG-UVD1P at many repeater sites with multiple close spaced transmitters with no problems regarding selectivity.

I am absolutely amazed at some people. They pay $100 for a radio and expect miracles and then when miracles do not happen complain that it is a faulty radio, bad engineering, defective equipment, etc. etc. etc.

Come on people. I bet you didn't disect your prior radio like you do the Wouxun. The radio is a great communications tool for what it is and for the price you paid. If it doesn't perform to your liking, sell it and go pay your $350-$700 for the dual band that fits your needs but please, let's give the little gem its proper due.

I have noticed the following: Two repeaters sharing the same space on a building roof. Their TX frequencies are 1,000 mhz apart. At times, I am able to RX one repeater signal on both the two frequencies showing in my display.
1. Is this intermodulation distortion?
2. Is this a design fault in the KG-UVD1P?

Actually he wrote 1,000mhz which is probably 1Hz apart. I suspect he really meant 1000KHz or 1MHz! That would make sense. I would be surprised if there was no intermod problems if the power is quite high and close to the radio. I'm very happy with the intermod performance of my KG-UVD1 and it's the equal of any other handheld I have.

I do wish people would get the frequency descriptor correct as it is case sensitive:

Hz = 1Hz of course
MHz = 1000000 Hz (Mega)
mHz = 0.001 Hz (milli)
KHz = 1000 Hz

Note the difference between mHz and MHz! Also, the H in Hz should always be upper case as it is derived from a persons name.

Just being picky but it always annoys me when I have to interpret what the person is trying to get across. We all make mistakes of course, I'm just trying to be helpful, not too grumpy!

1 thousand Mhz apart... please evaluate and perhaps correct your decimal place. 1000 Mhz will not impact ANY radio insofar as interference.

Thanks to all who responded.

1. I am about 8 miles from the antenna site.
2. The frequencies in question and I guess I meant about 1khz.
146.850
> 145.410
So that is 1.440khz difference.
3. After a very long time on HF,I wanted to see what VHF and UHF repeaters were all about. Hence, I decided on this rig to satisfy my curiosity. So if I enjoy it, I'll eventually upgrade.

I hope this clarifies my queries?

after looking at the right numbers it is starting to sound like inter-mod what two frequencies are the receiver tuned to if the display and what repeaters are you hearing

146.850MHz-145.410MHz=1.44MHz
I am pretty sure the KG-UVD1P selectivity would separate these frequencies at 8 miles, so it probably is intermod or magic.

Sounds to me like the two repeaters are mixing with an AM broadcast station... Go out and find that rusty bolt near you that is acting as a diode... We had an inter-mod problem with our 2 meter repeater in Silver Spring, MD and a nearby AM station in Laurel, MD... It was on 600KHZ.... Causing the repeater output to appear on the repeater input (600KHZ offset)... We found the "rusty" bolt causing the mixing on a nearby tower... Replaced the "rusty" bolt and the IM went away. Remember... When you mix RF you get the the operating frequencies AND all of the odd and even combinations... You'll even get mixing of all of the products we just mention... It's natures way of having fun. Don't assume it's the radio. A little corrosion ANYWHERE can create this RF problem.

And don't forget that many Europeans is a comma as a Decimal Point - so 1,000MHz is actually ONE Meg in "their language"! (a much more possible frequency difference)

My Wouxun does not like 50 wattts radiated from my FT-857 trnansmitting close by and in the 2m band - But Hey - what rig would!

I have a commercial Kenwood with local ham channels in my car and my KG in my pocket and when I go by a local taxi base, the Kenwood will pick up the station, the KG is silent. Darn good $100 radio.

Inter-mod is an engineering nightmare. Industry Canada (and probably the FCC) inputs 100 frequencies in order to determine the possibility of inter-mod when they assign frequencies. One of our club frequencies was involved in creating interference to an airline's VHF-AM channel on a their fleet of 737's. Our taxi frequency in Manitoba would get inter-mod when the ham repeater 10 miles away, the school bus base and the phone company paging went off. We never found the cause.

It is not a distortion issue but the math of heterodyning (sp?).

Id imagine he is talking about the box on the right of the page at
http://www.wouxun.com/.

IIRC previous discussions on this, or possibly other groups, this list
is referring to individual features available across various radios in
Wouxon's range. Ie, there is a radio that supports 5 (ie selcall) or
2-tone, there is another with scrambler function. Correct me
if I'm wrong, but I don't think there is a radio which supports _all_ of
these.

Regards,

Lee

Over the last few months, I have really got to like these little radios. I, like many others wish there was a 2.5 step setting. But for the price, they are still great.

I have bought all my radios from Main Trading Company in Paris, TX (MTC of eBay). He sells a lot of other stuff I like so I stop in often. One of the things that I liked was getting a total package for one price. My radios came with the regular stuff, plus the programing cable and disc to program it.

I am waiting for a mobile dual bander. I hear it is coming and will probably get one or more if the they are priced right. Meanwhile, my handhelds will have to do. I now have four of them. They are pretty rugged. Ran one over with my tractor and only broke the belt clip.

If you are in the area about 100 miles Northeast of Dallas, look for me on 146.565 Mhz simplex. If you can, stop in to MTC in Paris. It is one block west of the square on US 82 (bus.)_It is like a hamfest in a store.

Still hard for me to believe that there is a handheld radio dual bander for $120.00.

Hi Adam,

I think the problem is that most Ham frequencies are based around a 12.5kHz step size. And you can't do all of those if you set your radio for 5k or 10k steps.

I could be wrong, but I think that it is non-ham applications who use "wierd" frequencies that can only be achieved with 2.5k steps (please correct this "G3" if I misinterpreted). I think the more polite term for these frequencies is "splinter" frequencies - and goodness knows why the USA authorities have decided to inflict these "odd" ones into their band planning! (somebody out there may be able to tll me!)

For Hams, I don't think there is any problem with the steps that are available from our Wouxuns (or the other brands) as we (in Europe at least) currently use 12.5k steps, having followed the surplus market when "Business" radios have moved from 50k to 25k to 12.5 k - and we'll probabky start buying up second-hand 12.5k Business radios when they are moved to 6.25k channel spacing! - but the Wouxun is ready for that day!

Having said that, it would be good for the Ham market if Wouxon (presumably in future rigs) could make narrower step sizes availailable for the "splinter frequencies", as he more customers thay can attract to these excellent little rigs, the cheaper thay can manufacture and the lower the cost that us Hams can pay for them! Everybody wins!

Out of curiosity, what frequencies are people using that require a 2.5 step that the 6.25 step doesn't cover?

I installed the driver on the computer for the progamming software. According to instruction #4, when the rig is connected to the computer the computer is supposed to detect the rig's presence and automatically locate the software procedure folder. However, there is no detection and there is no folder or icon within it. What can I do to get to the programming interface?

There are going to be splinter frequencies that are in between the frequency spread used currently. Railroads are a perfect example. In the link below you will see Channel Numbers that begin with 0. The there are ones that begin with 1. The one's that begin with 1 are the splinter frequencies. When the railroads are required to go to 6.25 khz bandwidth then they will need the 2.5 khz spread between frequencies to accomodate the splinter frequencies.

☐

Hi Adam,

I think the problem is that most Ham frequencies
are based around a 12.5kHz step size. And you can't do all of
those if you set your radio for 5k or 10k steps.

I could be wrong, but I think that it is non-ham
applications who use "wierd" frequencies that can only be achieved with 2.5k
steps (please correct this "G3" if I misinterpreted). I think the more
polite term for these frequencies is "splinter" frequencies - and goodness knows
why the USA authorities have decided to inflict these "odd" ones into their band
planning! (somebody out there may be able to tll me!)

For Hams, I don't think there is any problem with
the steps that are available from our Wouxuns (or the other brands) as we (in
Europe at least) currently use 12.5k steps, having followed the surplus market
when "Business" radios have moved from 50k to 25k to 12.5 k - and we'll probabky
start buying up second-hand 12.5k Business radios when they are moved to 6.25k
channel spacing! - but the Wouxun is ready for that day!

Having said that, it would be good for the Ham
market if Wouxon (presumably in future rigs) could make narrower step sizes
availailable for the "splinter frequencies", as he more customers thay can
attract to these excellent little rigs, the cheaper thay can manufacture and the
lower the cost that us Hams can pay for them! Everybody wins!

224.96MHz goes into the 5 or 10 step just fine... Am I missing something
here? I'm new to ham radio, so the problem is likely my
understanding...

Find the executable using Explorer- It will be a file like KG-UVD1Pv1.16.exe Run the file and set the Communication port before talking to the radio. Read the radio first.

Yes please if there is one of these that does 2/5 Tone SELCALL AND the
inversion scrambler with the 420-520 UHF please advise....

480 won't cut it as we have systems in the 494 range now.

2/5 tone selcall and the inversion would be a huge plus v. one or the other.

I got you Les. The example you show (in the link) had 15kHz spacing, and is moving to half of that - 7.5kHz It's going to take a strange step size to accomodate that as well as the more usual 12.5kHz (with facility for 6.25)

I guess you are saying that they are going to be "standardised" on 6.25kHz at some time, but they will still need the 7.5 spacing during a transition period. Root of the problem seems to be that 15k spacing was chosen initially (or maybe even 30k befre that!), but now stuck with "coming into line" with 6.25.

Thanks, Stu

No, actually the cables driver that comes inthe box is for Vista or Windows 7. Download the XP driver from MTC.com or from wouxoun' s website. Once the cable driver is on your XP and you have run that program from your Desktop, connect your cable between the computer and radio., then load the programming diskette into your cd drive bay in your computer. That should get you there.

Good evening all. Thank you to everyone who replied to my original question. I ended up purchasing the UV2D from DBJre.com. Great service and super fast shipping. Excellent fellas, thank you.

I can confirm that the Puxing cable that came with my 777+ works with this Wouxun. I got it programmed using my PUXING serial programming cable and all my other Kenwood 2 plug acc. work just fine as well.

Two things I find odd compared to the Puxing... The ANI capability seems to be very limited. I cannot program a call sign or unit id (only can use characters abcd and numerals 0-9) and cannot select if it is on start TX or end TX. This is one thing the Puxing does provide.

Second, when I transmit there is a low level whine or background noise when received on any of my Puxing radios or my scanner.

None of my Puxing rigs generate this whine hen transmitting.

Overall fit an finish is very good and the unit feels like it is made well.

Last question... this radio shows J09 as a serial number. I am inferring from pervious posts that this indicates a firmware revision. Is there a method to update firmware via the programming cable?

Thanks in advance,

lou

With the new FCC narrowbanding rules in the US there are some new splinter channels that the radio will not program to. These are part of the new plan in the commercial bands. They will become more commonplace after Jan 2013 when all commercial VHF and UHF two way systems switch to the 12.5 kHz channel spacing rather than 25 kHz. This is not a problem for amateur radio but since these radios are also Part 90 type accepted and can be used in the commercial radio service it is an issue for some.

From: Ed Greany
Topic: 2776 Message: 2904

Lou,

I am happy you are pleased with your new radio.
I made contact with China just last week concerning the possibility of updating former firmware versions. The answer was no but they will offer the suggestion to their engineers for a possible modification in the future.

Personally, I have the 04 version for my personal use and find it perfectly acceptable for all my needs - and I have many. I manage 10 repeaters which include ham, GMRS, and Business including DTMF commands to a broadcast radio station that hides behind a DTMF code so that calls are of a 9-1-1 level.

While I stock the latest serial numbered units for sale on my shelf I do not find a demand for one version over another (like Beanie Babies of a decade ago). I also do not stock the UVD2 model for reasons which have already been discussed ad nauseam on this list.

Good evening all. Thank you to everyone who replied to my original question. I ended up purchasing the UV2D from DBJre.com. Great service and super fast shipping. Excellent fellas, thank you.

I can confirm that the Puxing cable that came with my 777+ works with this Wouxun. I got it programmed using my PUXING serial programming cable and all my other Kenwood 2 plug acc. work just fine as well.

Two things I find odd compared to the Puxing... The ANI capability seems to be very limited. I cannot program a call sign or unit id (only can use characters abcd and numerals 0-9) and cannot select if it is on start TX or end TX. This is one thing the Puxing does provide.

Second, when I transmit there is a low level whine or background noise when received on any of my Puxing radios or my scanner.

None of my Puxing rigs generate this whine hen transmitting.

Overall fit an finish is very good and the unit feels like it is made well.

Last question... this radio shows J09 as a serial number. I am inferring from pervious posts that this indicates a firmware revision. Is there a method to update firmware via the programming cable?

Thanks in advance,

lou

You are correct- I do hear real live DTMF tones during TX.

Hi guys

I am considering buying a spare battery.

Has anyone bought an extra battery and if so where from?

Thanks.

Theo.

I bought a spare battery for mine - 1700mA. I can't tell the difference between them without looking at the label.

When using the rig - such as at a fairly active Raynet event - I always take the fully charged spare, but I've ever needed it. I'm buying a second rig (XYL) and I'm not sure if I'll buy a 2nd battery for that one!

Not really. They seem to last a good long time. I can get them to die with 2 days heavy use; but it takes some doing :)

I usually charge at night when asleep, so my radios are ready to go the next day.

These radios use LiIon battaries. LiIon cells have limited lifetime from the date they are manufactured. Don't buy "spare cells" now so you'll have something on-the-shelf if the main cell dies.

I'm confused.
Don't buy a spare battery now leaving you with just one battery and when that battery dies you have NO battery? The alternative is to buy a second battery NOW so when one dies you still have an operational radio with a good battery until you can replace the bad one.

Good advice Rob.
My daily procedure is to leave a battery in the charger charging overnight.
My other battery is in the radio with the radio turned ON and the volume DOWN all the way.
The next morning, swap batteries.
This way they both cycle daily.
I've done this to many batteries and I actually have a couple batteries from my ADI radio that are some 20 years old - still kicking.

I got a spare battery from http://www.palmettoantennas.com/index.html when I got my radio last week. Had in three days. Bought from him because he's a us seller and all the reviews advised to do so for warranty and import reasons. And he has the software included in the price. He's also a good person to work with check out his call on QRZ.

I have extra batteries for all my radios. Keep an extra charged one with me in case I need it.

For the Wouxun radios, I got my extra batteries from Main Trading Company, Paris, Texas. MTC on eBay if you check. I am not sure what he is charging for them, but they are the 1700mha ones and work well.

While that method (cycling them daily) works GREAT with NiCd batteries, it's _certainly NOT_ recommended for lithium ion and lithium polymer batteries (or most lithium based rechargeable cells).

These batteries last longer when discharged less, kept topped off, no trickle charging, and regular (not fast) charging. They have a relatively high self-discharge, so if you don't use them much you should top them off every month or so.

If you discharge the Li-ion cells below 20% daily, you may significantly shorten their life, especially if you then use a fast charger to charge them.

http://www.google.com/search?q=lithium+ion+best+practices

Fortunately the charger being used is a smart lithium charger, so it's safe to leave the radio in there and it'll manage the battery just fine.

A better way of discharging the battery is using it to listen to FM broadcasts.

We in India did 2 group imports (30 and 65 sets)where we got the 1700mAH battery as standard accessory. But instead of getting another spare battery we got the drycell case, which worked with NiMH batteries in spite of being designed only for regular non rechargeable AA cells. I have not measured the amount of unused battery capacity while using NiMH cells when the radio shuts down due to low voltage.

I have a dry pack and have successfully used NiMh rechargeables in mine.
I've noticed no ill effects, although the battery gauge shows lower
than a full charge, which is expected.

I am always leery of "proprietary" battery packs, as well as you never
know when your LIon packs will fail. Being all mine were bought closely
together, I can assume they will all fail together. A dry pack will
keep me going until I get new packs.

I agree... Lithium Ions begin decomposing the day they are made. They
have a finite lifespan.

Definitely deep discharges hurt them. I use mine, then every night put
them to bed in the charger, regardless of use time. True, I have forgot
at times, and as well have ragchewed long enough to kill one.... yes you
can actually run one dead with normal use hi hi :)

Right now, I have 3 Wouxuns, and one spare pack between them.

Maybe its just me but I wasted my money on a kg-669 what a piece of crap can
t get alpha display to display names,even though I programmed them in using
the computer program the frequency's however take ok

The two knob version you can dial through the frequency's manually.
I have both a 2mtr /440 and a 2mtr/220 models and both work great

Subject: [Wouxun_KG-UVD1] KG-699E Questions

Regarding the 136-174MHz unit:

1) What is the difference between the one-knob and two-knob version?

The WOUXUN site shows both models but gives no substantive explanation of
each,
and, "409shop.com" only advertises the one-knob model and says the
200-memories
model is not available.

2) What does one order, and from whom, to get the so-called ADVANCED model
that
includes 200 memories, that is if it really exists?

3) Does anyone have hands-on experience with the VHF version of this radio?

Thanks,
Dave

Try some NiZn rechargeables with a nominal voltage of 1.6V per cell. I
purchased some by PowerGenix a few months ago and if they have a fatal flaw,
I haven't found it yet. They don't seem to be widely marketed, though.

I see PowerGenix cells available from a variety of sources. Before now, I had not heard of them. YouTube has several good video reviews on them, in particular for camera use. They seem to compare favorably with other battery chemistries. My concern was how many charge/discharge cycles they had the ability to withstand. The information I found states around 500 cycles, and that it takes around 2-1/2 hours to charge a set of four to full charge. Also- they self-discharge at a rate of 8% per month. I thought everyone following this thread would like to know these specifics...

Because the Wouxon case holds five cells, you'd be looking at two charge cycles. The manufacturer suggests that charging a single cell in their charger takes 1-1/2 hours, so you're looking at 4 hours total to charge five cells. Not bad!

1.5V alkaline cells I've tested with my DVM are all higher than 1.5V, in fact testing around the same as these cells (1.6V per cell). I would say they're a pretty darn good rechargeable replacement for this use, all things considered. I'll probably buy some after doing some research to determine who sells them at the best price and includes a charger for them. I'd probably buy around 20 of them.

It took me a while to find a charger that will charge any number (1-4) of NiMh cells at once - instead of either 2 or 4 only - and accept 120 or 220 volts for travel. Looks like that could be a problem for NiZn for the 5-cell Wouxun battery-pack (which I have, but never used as it's "not recommended" with my NiMh batteries). Not too good for 5 spare cells and the battery holder if you just want a "backup" for the standard battery-pack.

I do have a couple of other applications though with an even number of batteries - some "agricultural" instruments that use 4 batteries (but "AAA", so I'll have to wait for PowerGen to bring out AAAs), and the VK5JST antenna analyser kit http://groups.yahoo.com/group/VK5JST_Analysers/ that I am building that needs eight regular AA batteries and there's not enough room inside for ten NiCd or NiMh batteries but needs 12 volts supply!

There's a lot of information on NiZn to be found on Wikipedia, but beware that it may not be totally unbiased, and it looks as if it was partly or wholly written by PowerGen. However the technology would appear to be very promising and I'm very seriously considering buying NiZn rechargeable when I complete my antenna analyser kit.

Sadly, PowerGen appear to have a closed market due to patents, so we may not see as much "market forces" on price and (more importantly) variations such as multi-cell chargers.

2947. ARRL video review

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-26 15:42:32 UTC
From: Web Williams
Topic: 2947 Message: 2947

After reading the review in QST, I went looking on the ARRL website to see if they had an extended version of the product review. I didn't find that, but what I did find was a short video by Bob Allison of the ARRL lab describing an upcoming review of the Wouxun sets.

The first thing the reviewer points out is that Wouxun is pronounced "Oh-Sheng". So for those of us (me included) who have been calling them "woox un", we're wrong. I guess it's kind of like why they changed the spelling of Peking to Beijing a couple of decades ago.

The most curious part of the review (in my mind) is where the reviewer is demonstrating that the radio will speak to you. He first shows the radio speaking in Chinese, then changes to English. I can only surmise from listening to the review, that in English, the word "ENTER", when spoken in Chinese, sounds like "EAT $#[T"! Don't believe me? Go see the video for yourself! (The sound is 2 minutes and 11 seconds into the video.) I wonder what keystrokes were used to get it to say that? (I would avoid those button presses in the presence of young children...)

You may want to let the ARRL know. It's printed in
this month's QST as "Oh-Sheng". It's probably one
of those things that doesn't translate well. My wife is
from Laos, and there are many things that don't translate
directly to English. You just do the best you can, and
that's the end of it.

>>> I am considering buying a spare battery.

>> These radios use LiIon battaries. LiIon cells have limited lifetime from
>> the date they are manufactured. Don't buy "spare cells" now so you'll have
>> something on-the-shelf if the main cell dies.

> I'm confused.
> Don't buy a spare battery now leaving you with just one battery and
> when that battery dies you have NO battery? The alternative is to buy
> a second battery NOW so when one dies you still have an operational
> radio with a good battery until you can replace the bad one.

With the older NiCd/NiMh technologies, the lifetime of a battary was
mainly defined by the number of charge cycles (as well as inadvertent
reverse-charges, for instance when discharging the cell too deep).
But, buy a pack today, put it on the shelf for 5 years and in
5 years it will be as good as new (after a few charges).

In come LiIon cells. They have limited lifetime from *manufacturing date*,
in addition to the charge cycles we know from Nickel cells.
That is, if you buy a pack now, shelf it for 5 years, you'll find
that the pack has degraded significantly and may already have passed out
even if you didn't use it.

This is not a Wouxun problem, all LiIon-based packs have this problem:
laptops, cameras, etc.

By all means, buy an extra pack, but don't expect to be able to
shelf it and use it in a few years once the main pack has died,
because your "spare" may be well on it's way out as well.

2957. My last week's question about intermodulation

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-27 00:00:17 UTC
From: mefazamy
Topic: 2957 Message: 2957

Last week I posted the inquiry about intermodulation and the KG-UVD1P because with the two different frequencies appearing in the opening screen, one repeater frequency sometimes would be received on the other displayed frequency. However, when you display the frequencies in the TDR screens individually, the frequencies do not interfere with each other. I do not recall seeing this in the manual. However, I could be wrong.

Topic: 2907 Message: 2958

I found some very good reviews of the PowerGenix batteries.
One thing nobody has mentioned (myself included because I
did not know) is that they're rated in milliWATT-HOURS, not
milliAMPS of capacity. According to what I read, the amp-hour
capacity of these cells is 2000, so use that number when you
compare them to NiMh and NiCad cells.

http://www.amazon.com/PowerGenix-PGX-4AAZiNc-1-6v-Voltage-Rechargeable-Batteries/dp/B0029LHXG2

In spite of some minor issues, they still look like the better way
to go for amateur radio purposes. I found some on eBay that
were reasonable that I'll probably buy and try.

Do you have the frequencies of both repeaters in the A and B frequencies at the same time? If so, the reason is probably the "dual watch" working!

Subject: [Wouxun_KG-UVD1] My last week's question about intermodulation

Last week I posted the inquiry about intermodulation and the KG-UVD1P because with the two different frequencies appearing in the opening screen, one repeater frequency sometimes would be received on the other displayed frequency. However, when you display the frequencies in the TDR screens individually, the frequencies do not interfere with each other. I do not recall seeing this in the manual. However, I could be wrong.

Same here... I hit the THR to just get the 2M frequency to broadcast out. When I left both the 144s n the 440s showing.... I was broadcasting out on both at the same time, thereby blocking any transmission. Clear as a bell when I just have one band showing.

From the KY forum on Radio Reference-

Kentucky Revised Statutes (2002)
Title XL - Crimes and Punishments
Chapter 432 - Offenses Against the State and Public Justice
§ 432.570
432.570 Possession or use of radio capable of sending or receiving police messages restricted; Penalty; Enforcement

(1) It shall be unlawful for any person except a member of a police department or police force or an official with written authorization from the head of a department which regularly maintains a police radio system authorized or licensed by the Federal Communications Commission, to have in his or her possession, or in an automobile or other vehicle, or t o equip or install in or on any automobile or other vehicle, any mobile radio set or apparatus capable of either receiving or transmitting radio or other messages or signals within the wavelength or channel now or which may hereafter be allocated by the Federal Communications Commission, or its successor, for the purpose of police radios, or which may in any way intercept or interfere with the transmission of radio messages by any police or other peace officers and it shall be unlawful for any car, automobile, or other vehicle other than one publicly owned and entitled to an official license plate issued by the state issuing a license to a said car, to have, or be equipped with the sets or apparatus even though said car is owned by an officer. This Section shall not apply to any automobile or vehicle owned or operated by a member of a Sheriff's Department authorized by the fiscal court to operate a radio communications system that is licensed by the Federal Communications Commission or other federal a gency having the authority to license same. Nothing in this Section shall preclude a probation and parole officer employed by the Department of Corrections from carrying on his person or in a private vehicle while conducting his official duties an

authorized, state-issued portable radio apparatus capable of transmitting or receiving signals.

(2) Any person guilty of violating any of the provisions of this Section shall be guilty of a misdemeanor, and, upon conviction, shall be punished by a fine of not less than fifty dollars ($50) and not exceeding five hundred dollars ($500), or imprisonment not exceeding twelve (12) months, or both so fined and imprisoned.

(3) It shall be the duty of any and all peace officers to seize and hold for evidence any and all equipment had or used in violation of the provisions of this Section, and, upon conviction of the person having, equipping or using such equipment, it shall be the duty of the trial court to order such equipment or apparatus destroyed, forfeited, or escheated to the Commonwealth of Kentucky, and said property may be ordered destroyed, forfeited, or escheated as above provided without a conviction of the person charged with violating this Section.

(4) Nothing contained in this Section shall prohibit the possession of a radio by:

(a) An individual who is a retailer or wholesaler and in the ordinary course of his business offers such radios for sale or resale;

(b) A commercial or educational radio or television station, licensed by the Federal Communications Commission, at its place of business; or

(c) An individual who possesses such a radio, provided it is capable of receiving radio transmissions only and is not capable of sending or transmitting radio messages, at his place of residence; licensed commercial auto towing trucks; newspaper reporters and photographers; emergency management agency personnel authorized in writing by the Director of Division of Emergency Management (for state personnel) or Chief Executive of the city or county (for thier respective personnel); a person holding a valid license issued by the Federal Communications Commission in the Amateur Radio Service; peace officers authorized in writing by the head of thier law enforcement agency, Commonwealth's attorneys and thier assistants, county attorneys and thier assistants, except that it shall be unlawful to use such radio to facilitate any criminal activity or to avoid apprehension by law enforcement officers. Violation of this Section shall, in addition to any other penalty prescribed by law, result in a forfeiture to the local law enforcement agency of such radio.

(5) The Secretary of the Finance and Administration Cabinet is hereby empowered by issuance of a Secretary's Order to exempt from the prohibitions and penalties of this Section the possession and use of any and all radio communication equipment that he finds is necessary to be owned and used by members of the general public and other nonpolice persons for utilization in the N.O.A.A. weather radio system.

I am Glad that i don't live in KY But MY Ham license is isued by the Fcc and is good in 50 states and a few territories . I think it lets me cary My ht any where i want and listen to un scrambled communication where every I find it as long as I do not use my rig to commit a crime

The scanner Law below was written so the Sheriff of Boon County can Collect more money from his speed trap when he catches an out of state trucker with a scanner .

Harassing A a person holding a valid license issued by the Federal Communications Commission in the Amateur Radio Service is not allowed by the law as written.

So i think my wouxun is legal all day long

Kentucky Revised Statutes (2002)

Title XL - Crimes and Punishments

Chapter 432 - Offenses Against the State and Public Justice

§ 432.570

432.570 Possession or use of radio capable of sending or receiving

police messages restricted; Penalty; Enforcement

(1) It shall be unlawful for any person except a member of a police department or police force or an official with written authorization from the head of a department which regularly maintains a police radio system authorized or licensed by the Federal Communications Commission, to have in his or her possession, or in an automobile or other vehicle, or t o equip or install in or on any automobile or other vehicle, any mobile radio set or apparatus capable of either receiving or transmitting radio or other messages or signals within the wavelength or channel now or which may hereafter be allocated by the Federal Communications Commission, or its successor, for the purpose of police radios, or which may in any way intercept or interfere with the transmission of radio messages by any police or other peace officers and it shall be unlawful for any car, automobile, or other vehicle other than one publicly owned and entitled to an official license plate issued by the state issuing a license to a said car, to have, or be equipped with the sets or apparatus even though said car is owned by an officer. This Section shall not apply to any automobile or vehicle owned or operated by a member of a Sheriff's Department authorized by the fiscal court to operate a radio communications system that is licensed by the Federal Communications Commission or other federal a gency having the authority to license same. Nothing in this Section shall preclude a probation and parole officer employed by the Department of Corrections from carrying on his person or in a private vehicle while conducting his official duties an authorized, state-issued portable radio apparatus capable of

transmitting or receiving signals.

(2) Any person guilty of violating any of the provisions of this Section shall be guilty of a misdemeanor, and, upon conviction, shall be punished by a fine of not less than fifty dollars ($50) and not exceeding five hundred dollars ($500), or imprisonment not exceeding twelve (12) months, or both so fined and imprisoned.

(3) It shall be the duty of any and all peace officers to seize and hold for evidence any and all equipment had or used in violation of the provisions of this Section, and, upon conviction of the person having, equipping or using such equipment, it shall be the duty of the trial court to order such equipment or apparatus destroyed, forfeited, or escheated to the Commonwealth of Kentucky, and said property may be ordered destroyed, forfeited, or escheated as above provided without a conviction of the person charged with violating this Section.

(4) Nothing contained in this Section shall prohibit the possession of a radio by:

(a) An individual who is a retailer or wholesaler and in the ordinary course of his business offers such radios for sale or resale;

(b) A commercial or educational radio or television station, licensed by the Federal Communications Commission, at its place of business; or

(c) An individual who possesses such a radio, provided it is capable of receiving radio transmissions only and is not capable of sending or transmitting radio messages, at his place of residence; licensed commercial auto towing trucks;

newspaper reporters and photographers; emergency management agency personnel authorized in writing by the Director of Division of Emergency Management (for state personnel) or Chief Executive of the city or county (for thier respective personnel); a person holding a valid license issued by the Federal Communications Commission in the Amateur Radio Service; peace officers authorized in writing by the head of thier law enforcement agency, Commonwealth's attorneys and thier assistants, county attorneys and thier assistants, except that it shall be unlawful to use such radio to facilitate any criminal activity or to avoid apprehension by law enforcement officers. Violation of this Section shall, in addition to any other penalty prescribed by law, result in a forfeiture to the local law enforcement agency of such radio.

(5) The Secretary of the Finance and Administration Cabinet is hereby empowered by issuance of a Secretary's Order to exempt from the prohibitions and penalties of this Section the possession and use of any and all radio communication equipment that he finds is necessary to be owned and used by members of the general public and other nonpolice persons for utilization in the N.O.A.A. weather radio system.

Make sure... MAKE ABSOLUTELY SURE! that that radio can ONLY trnasmit in
the ham bands!!! Use the "unlock" software to lock it down for only ham
band transmit!!!

Yes I did have the frequencies of both repeaters in the A and B frequencies at the same time. So the rig is dual watching? Please explain

Thanks

Yes I did have the frequencies of both repeaters in the A and B frequencies at the same time. So the rig is dual watching? Please explain

Thanks

Are you aware that both display frequencies are active independent of the A/B switch setting?

The rig is always "listening" to both A and B frequencies. If a signal is picked up on either, the rig will select that one to drive the audio output.

My XYL and I use this feature so that I can wander around listening on 2m and she (as yet not licensed) can use a European "PMR466" license-free rig (like USA FRSS) which I am monitoring on my Wouxun. (The Wouxun can also work/monitor on FRS, although at slightly too high power in "low power" mode!)

I also use this feature to listen for any calls on our local repeater wherever I an roaming on V/Uhf. To avoid the problem with picking up two repeaters if you don't want to - just select the SAME frequency on A and B!

Stu

Look at 4(c). You might get away with carrying a radio that is capable of
receiving only if you are a licensed HAM radio operator.. maybe.

But, It cannot be capable of transmitting on transmitting within wavelength
for police radios.

Kent

KQ4KK

From the KY forum on Radio Reference-

Kentucky Revised Statutes (2002)
Title XL - Crimes and Punishments
Chapter 432 - Offenses Against the State and Public Justice
§ 432.570
432.570 Possession or use of radio capable of sending or receiving police messages restricted; Penalty; Enforcement

(1) It shall be unlawful for any person except a member of a police department or police force or an official with written authorization from the head of a department which regularly maintains a police radio system authorized or licensed by the Federal Communications Commission, to have in his or her possession, or in an automobile or other vehicle, or t o equip or install in or on any automobile or other vehicle, any mobile radio set or apparatus capable of either receiving or transmitting radio or other messages or signals within the wavelength or channel now or which may hereafter be allocated by the Federal Communications Commission, or its successor, for the purpose of police radios, or which may in any way intercept or interfere with the transmission of radio messages by any police or other peace officers and it shall be unlawful for any car, automobile, or other vehicle other than one publicly owned and entitled to an official license plate issued by the state issuing a license to a said car, to have, or be equipped with the sets or apparatus even though said car is owned by an officer. This Section shall not apply to any automobile or vehicle owned or operated by a member of a Sheriff's Department authorized by the fiscal court to operate a radio communications system that is licensed by the Federal Communications Commission or other federal a gency having the authority to license same. Nothing in this Section shall preclude a probation and parole officer employed by the Department of Corrections from carrying on his person or in a private vehicle while conducting his official duties an authorized, state-issued portable radio apparatus capable of transmitting or receiving signals.

(2) Any person guilty of violating any of the provisions of this Section shall be guilty of a misdemeanor, and, upon conviction, shall be punished by a fine of not less than fifty dollars ($50) and not exceeding five hundred dollars ($500), or imprisonment not exceeding twelve (12) months, or both so fined and imprisoned.

(3) It shall be the duty of any and all peace officers to seize and hold for evidence any and all equipment had or used in violation of the provisions of this Section, and, upon conviction of the person having, equipping or using such equipment, it shall be the duty of the trial court to order such equipment or apparatus destroyed, forfeited, or escheated

to the Commonwealth of Kentucky, and said property may be ordered destroyed, forfeited, or escheated as above provided without a conviction of the person charged with violating this Section.

(4) Nothing contained in this Section shall prohibit the possession of a radio by:

(a) An individual who is a retailer or wholesaler and in the ordinary course of his business offers such radios for sale or resale;

(b) A commercial or educational radio or television station, licensed by the Federal Communications Commission, at its place of business; or

(c) An individual who possesses such a radio, provided it is capable of receiving radio transmissions only and is not capable of sending or transmitting radio messages, at his place of residence; licensed commercial auto towing trucks; newspaper reporters and photographers; emergency management agency personnel authorized in writing by the Director of Division of Emergency Management (for state personnel) or Chief Executive of the city or county (for thier respective personnel); a person holding a valid license issued by the Federal Communications Commission in the Amateur Radio Service; peace officers authorized in writing by the head of thier law enforcement agency, Commonwealth's attorneys and thier assistants, county attorneys and thier assistants, except that it shall be unlawful to use such radio to facilitate any criminal activity or to avoid apprehension by law enforcement officers. Violation of this Section shall, in addition to any other penalty prescribed by law, result in a forfeiture to the local law enforcement agency of such radio.

(5) The Secretary of the Finance and Administration Cabinet is hereby empowered by issuance of a Secretary's Order to exempt from the prohibitions and penalties of this Section the possession and use of any and all radio communication equipment that he finds is necessary to be owned and used by members of the general public and other nonpolice persons for utilization in the N.O.A.A. weather radio system.

One of the most convoluted wording and intent. One of the fundamental tenants of the FCC licensing provides those licensed to transmit as well as receive transmissions.
What yahoo came up with this ordinance?

When you transmit the receiver is disabled to prevent feedback. That is for both A&B sides.

Look at 4(c). You might get away with carrying a radio that is capable of receiving only if you are a licensed HAM radio operator.. maybe.

But, It cannot be capable of transmitting on transmitting within wavelength for police radios.

From the KY forum on Radio Reference-

Kentucky Revised Statutes (2002)
Title XL - Crimes and Punishments
Chapter 432 - Offenses Against the State and Public Justice
§ 432.570
432.570 Possession or use of radio capable of sending or receiving police messages restricted; Penalty; Enforcement

(1) It shall be unlawful for any person except a member of a police department or police force or an official with written authorization from the head of a department which regularly maintains a police radio system authorized or licensed by the Federal Communications Commission, to have in his or her possession, or in an automobile or other vehicle, or t o equip or install in or on any automobile or other vehicle, any mobile radio set or apparatus capable of either receiving or transmitting radio or other messages or signals within the wavelength or channel now or which may hereafter be allocated by the Federal Communications Commission, or its successor, for the purpose of police radios, or which may in any way intercept or interfere with the transmission of radio messages by any police or other peace officers and it shall be unlawful for any car, automobile, or other vehicle other than one publicly owned and entitled to an official license plate issued by the state issuing a license to a said car, to have, or be equipped with the sets or apparatus even though said car is owned by an officer. This Section shall not apply to any automobile or vehicle owned or operated by a member of a Sheriff's Department authorized by the fiscal court to operate a radio communications system that is licensed by the Federal Communications Commission or other federal a gency having the authority to license same. Nothing in this Section shall preclude a probation and parole officer employed by the Department of Corrections from carrying on his person or in a private vehicle while conducting his official duties an authorized, state-issued portable radio apparatus capable of transmitting or receiving signals.

(2) Any person guilty of violating any of the provisions of this Section shall be guilty of a misdemeanor, and, upon conviction, shall be punished by a fine of not less than fifty dollars ($50) and not exceeding five hundred dollars ($500), or

imprisonment not exceeding twelve (12) months, or both so fined and imprisoned.

(3) It shall be the duty of any and all peace officers to seize and hold for evidence any and all equipment had or used in violation of the provisions of this Section, and, upon conviction of the person having, equipping or using such equipment, it shall be the duty of the trial court to order such equipment or apparatus destroyed, forfeited, or escheated to the Commonwealth of Kentucky, and said property may be ordered destroyed, forfeited, or escheated as above provided without a conviction of the person charged with violating this Section.

(4) Nothing contained in this Section shall prohibit the possession of a radio by:

(a) An individual who is a retailer or wholesaler and in the ordinary course of his business offers such radios for sale or resale;

(b) A commercial or educational radio or television station, licensed by the Federal Communications Commission, at its place of business; or

(c) An individual who possesses such a radio, provided it is capable of receiving radio transmissions only and is not capable of sending or transmitting radio messages, at his place of residence; licensed commercial auto towing trucks; newspaper reporters and photographers; emergency management agency personnel authorized in writing by the Director of Division of Emergency Management (for state personnel) or Chief Executive of the city or county (for thier respective personnel); a person holding a valid license issued by the Federal Communications Commission in the Amateur Radio Service; peace officers authorized in writing by the head of thier law enforcement agency, Commonwealth's attorneys and thier assistants, county attorneys and thier assistants, except that it shall be unlawful to use such radio to facilitate any criminal activity or to avoid apprehension by law enforcement officers. Violation of this Section shall, in addition to any other penalty prescribed by law, result in a forfeiture to the local law enforcement agency of such radio.

(5) The Secretary of the Finance and Administration Cabinet is hereby empowered by issuance of a Secretary's Order to exempt from the prohibitions and penalties of this Section the possession and use of any and all radio communication equipment that he finds is necessary to be owned and used by members of the general public and other nonpolice persons for utilization in the N.O.A.A. weather radio system.

Local rule will over seat state law in a local rule state that why local city's will wright a law the same as the state so they get the money from the fine. The simple thing to do is set a 440 simplex channel as the transmit channel so you will not be on there channel transmitting. The radio will split band I tried it to make sure. I did this on a modded radio I got that was told was not modded. Of course you will not here any one reply but you would be legal.

It's not a dual receiver but just a single receiver that switches rapidly between the two frequencies. It works like a two channel scanner when it's receiving. So you will never hear both frequencies at the same time. Also you can't hear the other channel when transmitting as the receiver is muted.

Grant, ZL2BK
IRLP nodes 6081 and 6285.

When you transmit the receiver is disabled to prevent feedback. That is for both A&B sides.

Would that not cause an issue of feedback and/or cause you
to hear yourself if you transmit into a repeater with your
receiver "B" set to listen to the repeater output freq? It might
also damage sensitive receiver components if the frequency
that you transmit on and the frequency you set to receive in
VFO "B" are too close together. Just a thought.

If you want a Rx only channel, just leave the Tx blank in the software setup.

2983. Warranty Question

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-10-28 13:32:40 UTC
From: ofinterest2me.com
Topic: 2983 Message: 2983

If my new radio arrives and is locked between certain parameters, would I invalidate the warranty if I used the unblocking software to set ne parameters ?

Kindest regards,

James (UK Call G1SSO)

I suspect warranty is not really an issue unless you bought it from a local dealer. In my case, shipping two ways to Hong Kong makes the warranty about useless. Also, if you set the unlock back to original no one would know what you had done.

I used to run AVG software and got so sick of it not allowing me to run software, that I kicked it into touch and installed another FREE software called Avast !

Everything ok after that.

Hi Mark, yes you are correct. I have ordered it from Martin Lynch & Son. I am told that they are waiting for new stock to come in which will be early November so I should get it round aboout the 10th. Can't wait. It will be the very first new radio I have had since becoming licenced in 1986. In the past I have made do with PMR stuff.

this is not a problem Florida has the same law
as long as you have an fcc regulated license in the amateur service u can carry any radio that can transmit out of band as long as you only use it out of band in an emergency and only if it is the only means of communication

Dave,

If you have tried every version then it presupposes that the issue is not with the software.
This has been discussed over and over in this group - see archives.
The warning is a false alert. The software is fine. Try another computer or temporarily suspend your virus program to get past this road block.

The rig is always "listening" to both A and B frequencies. If a signal is picked up on either, the rig will select that one to drive the audio output.

This explanation makes sense to me. My rig operates like this because in my situation, one repeater is very active, and the other is usually quiet. Two or three times while I was listening to the active repeater while it was quiet, I heard the station ID of the quiet repeater.

Thanks Stu

Over the past few months, I have purchased six of these great little radios from Main Trading Company (MTC on eBay) along with accessories. These six radios total cost is less than I paid for my Yaesu VR-8 with GPS and a lot of accessories. I like my toys. This brings me to the point of the post.

When are we going to see these radios force the price of long standing brand name radios to decrease. These radios are filling a need at a price that about anyone can afford. I have no idea what the impact is on marketing for the other manufactures, but I know MTC has sold a whole bunch and he is just on supplier. I am looking forward to a price war with some of the other manufactures involved. This would be good for me and for Ham radio as a whole. I know of a couple of people who are thinking of getting a tech license with these radios available.

Still, I have not noticed any reaction from the other manufactures in regards to price reductions.

Sounds like a com port issue if you are using a usb cable check the Driver in SYSTEM ICON in the control panel make sure there are no errors and you have the right comport selected in the software.

if all that seems right try another cable

It'll take time. Remember that The Big Boys have a gigantic and expensive marketing program to support. It will take some adjustment on their way of thinking and pricing. I also suspect that the major component of "Tech Support" and warranty is falling on the distributors and not the factory (tell me if I'm wrong!)

There's also a lot of us that'll not buy "the unknown", despite the low price, and that inertia works in The Big Boys' favour.

There's another scenario to though - if "Little Brother" really takes off (and maybe improves the awful translation of the manual!!) they might decide they can afford to put the prices UP and join The Big Boys!

(I've just ordered my second one - I'm betting on the XYL passing her Foundation License in 9 days time and an easy choice to make for her Christmas present!)

Over the past few months, I have purchased six of these great little radios from Main Trading Company (MTC on eBay) along with accessories. These six radios total cost is less than I paid for my Yaesu VR-8 with GPS and a lot of accessories. I like my toys. This brings me to the point of the post.

When are we going to see these radios force the price of long standing brand name radios to decrease. These radios are filling a need at a price that about anyone can afford. I have no idea what the impact is on marketing for the other manufactures, but I know MTC has sold a whole bunch and he is just on supplier. I am looking forward to a price war with some of the other manufactures involved. This would be good for me and for Ham radio as a whole. I know of a couple of people who are thinking of getting a tech license with these radios available.

Still, I have not noticed any reaction from the other manufactures in regards to price reductions.

Hi friends,

Just a general business observation... more established vendors will most likely endeavor to take some action in response to the Wouxun (and other low-price Chinese manufacturer) offerings only when they deem that the Chinese manufacturers are having a material effect on their business.

And while the action that the more established manufacturers take could include lower prices, the action could also include offering new models of lower-tier radios at lower prices, rather than dropping prices of their high-end products.

First make sure cable is in tight.
Second make sure the correct com port is selected.
Third I have had to unplug my USB cable wait a few seconds plug it back in and it finds it.
I also use Windows 7.

Besides the other advice that has been given; have you tried connecting multiple times? click the button once, and then wait for the failure message. Then click it again. I think this was a noted bug at one point in time; failure to connect the first time but establishing a connection the second.

Good luck

I found that if I have the radio ON while I'm programming using the software, the radio will go into a sleep mode. Then when I attempt to download, it fails but when I do it again, the first attempt has awoken the radio and it accepts the second attempt.

Therefore, I believe if you wake up the radio before downloading or better yet, leave it OFF and then just before programming it turn it ON, it will work okay for you.

I don't see where anyone has mentioned making sure that on the
"optional function" page, the frequencies must be within the
capabilities of the radio. My software came set with the "Frequency
Mode (A Band) to 400.02500, and my radio refused to program
until I set that frequency to somewhere in the VHF or 220 range
(my set is the 2M/220 variety). Just something else to check.

Here's a new turn of events.

I have been communicating with Wouxun over a matter they brought to my attention and asked for assistance on. It seems a competitor of theirs is suggesting to potentional customers (and actual customers) that the Wouxun is not type-accepted or FCC Certified. They were honing in on the Part15 area.

I did some research for them at their request and the KG-UIVD1P "IS" in fact certified for Part 90 AND Part 15 and no label is required. Part 15 is predominately addressed with wireless objects that offer RF unintentionally. Some gadgets might be your TV remote or garage door remote, a light dimmer switch, a toy, computer screens, etc. These devices require the tag notice applied to them. During the routine Part 90 certification process, the RF and EMF measurements are done as part of the testing and so when the Part 90 certification is awarded there is no need to place the additional Part 15 on the tag. If a radio is approved Part 90 then it automatically is approved for Part 15. I think this is unfair competition and downright lies to the public or consumer by the other competitive company or companies. Wouxun did not disclose to me the name of the other company but one can only imagine.

It is not cheap to attain certification by the FCC so when you have a radio or device that has gone through the process, you can be comfortable knowing it probably is a reputable company.

With Windows 7 you will need the proper drivers. It may be in files section here... or the Wouxun site.

ALSO, Windows 7 is tricky.. maybe XP also. Win 7 likes to "lose" ports, and then next time you plug in your cable, it reassigns another port number. The software can get confused and you have to go port hunting. After a while, the number of "lost ports" grows to where many devices can become unusable.

I solved this by going into device manager and displaying "hidden" devices, and deleting all ports that weren't currently active... both com ports and usb ports.

After this, reboot. Plug in your cable, and the software should list a proper port for you to select.

Note: It is likely you need to enable this function. Go here for the how-tos:

http://www.sevenforums.com/tutorials/77614-device-manager-hidden-devices.html

I have found this corrected my problem with a LOT of usb devices, not just the Wouxun cable.

A copy of the certification is easily obtained. Part 15 devices include
two-way radios that radiate up to (but not exceeding) 100 milliwatts
on certain frequencies. Cordless phones, 27MHz and 49MHz
kiddie-talkies, etc. fall under Part 15. Part 15 is not only unintentional
radiators, although they might fall under that section. I think RFID
chips also fall under Part 15 (but I could be mistaken).

I always knew that, since any FCC type-acceptance, automatically covers
Part 15.

There are a lot of companies that are gonna get mad, scared, or both,
and resort to mudslinging campaigns and other assorted dirty tricks.

If someone has done this already, then you know they feel threatened.

Since QST published a review, that means the radio has the blessings of
the ARRL, which means the Big Boys are definitely going to have their
attention on things now. This also means, a lot of hams leery of buying
this radio from an "unknown" entity, may reconsider.

Universal Radio here carries the TYT radio, similar to our Wouxuns.
"rumor" has it the owner declined the Wouxuns due to the availability of
"unlock software" and has had TYT send them models set specifically for
the ham bands.

If you see the major Ham retailers selling a VERY low cost radio, you
can be sure the big boys WILL notice.

The one thing this also has the potential to do is hurt the ARRL. The league makes a lot of money on advertising in QST and they are always careful to not step on too many toes of the big advertisers. I quite frankly was surprised to see the Wouxon reviewed in the magazine. The price of membership and magazine distribution could be greatly affected if the major players change their marketing tactics and attempt to lower the radio prices. More cause and effect. I like my radio but wonder how this will changes things in QST and other magazines.

I always knew that, since any FCC type-acceptance, automatically covers
Part 15.

There are a lot of companies that are gonna get mad, scared, or both, and resort to mudslinging campaigns and other assorted dirty tricks.

If someone has done this already, then you know they feel threatened.

Since QST published a review, that means the radio has the blessings of the ARRL, which means the Big Boys are definitely going to have their attention on things now. This also means, a lot of hams leery of buying this radio from an "unknown" entity, may reconsider.

Universal Radio here carries the TYT radio, similar to our Wouxuns. "rumor" has it the owner declined the Wouxuns due to the availability of "unlock software" and has had TYT send them models set specifically for the ham bands.

If you see the major Ham retailers selling a VERY low cost radio, you can be sure the big boys WILL notice.

I do agree :)

Problem is.. if Wouxun pays for these ads, then their overhead
increases. The "big boys" crank out a lot of advertising dollars, which
we pay for every time we buy a rig. Wouxun is mostly internet and word
of mouth, which our cost is zero.

If Wouxun were to get some big ad campaign, I'm sure costs would have to
be picked up by increased equipment costs.

Now... of course... a one time deal.... :) Oh
Yeah... that would scare the big boys for sure :)

Yes.... if played right... WE surely ARE to benefit!

Can you imagine what would happen if Wouxun did a fold out ad or center fold ad in QST? It would turn ham radio equiptment in a dizzy nosedive for Kenwood, Yaesu, Icom, etc. Competition is healthy for our economy and for consumers. Let's see a price war start and who is to benefit? WE ARE!

Well I don't think the BIG BOY'S are ever going to lower the price on there radio "why" because of corporate greed for one for to why should they when they know the consumer will pay for two and for three supply and demand so its the same as the gas prices don't get me on that subject lol but really just think about it just putting my 2 cents worth in

The one thing this also has the potential to do is hurt the ARRL. The league makes a lot of money on advertising in QST and they are always careful to not step on too many toes of the big advertisers. I quite frankly was surprised to see the Wouxon reviewed in the magazine. The price of membership and magazine distribution could be greatly affected if the major players change their marketing tactics and attempt to lower the radio prices. More cause and effect. I like my radio but wonder how this will changes things in QST and other magazines.
